Valuing Diversity 258
Introduction
Project Overview

Project Goals
This Community Health Needs Assessment – a follow-up to similar studies conducted in 1996, 2000, 2003, 2006, 2009, and 2012 – is a systematic, data-driven approach to determining the health status, behaviors, and needs of residents in the service area of Columbus Regional Hospital. Subsequently, this information may be used to inform decisions and guide efforts to improve community health and wellness.

A Community Health Needs Assessment provides information so that communities may identify issues of greatest concern and decide to commit resources to those areas, thereby making the greatest possible impact on community health status. This Community Health Needs Assessment will serve as a tool toward reaching three basic goals:

- **To improve residents' health status, increase their life spans, and elevate their overall quality of life.** A healthy community is not only one where its residents suffer little from physical and mental illness, but also one where its residents enjoy a high quality of life.

- **To reduce the health disparities among residents.** By gathering demographic information along with health status and behavior data, it will be possible to identify population segments that are most at-risk for various diseases and injuries. Intervention plans aimed at targeting these individuals may then be developed to combat some of the socio-economic factors which have historically had a negative impact on residents' health.

- **To increase accessibility to preventive services for all community residents.** More accessible preventive services will prove beneficial in accomplishing the first goal (improving health status, increasing life spans, and elevating the quality of life), as well as lowering the costs associated with caring for late-stage diseases resulting from a lack of preventive care.

This assessment was conducted on behalf of Columbus Regional Hospital by Professional Research Consultants, Inc. (PRC). PRC is a nationally recognized healthcare consulting firm with extensive experience conducting Community Health Needs Assessments such as this in hundreds of communities across the United States since 1994.
Methodology

This assessment incorporates data from both quantitative and qualitative sources. Quantitative data input includes primary research (the PRC Community Health Survey) and secondary research (vital statistics and other existing health-related data); these quantitative components allow for trending and comparison to benchmark data at the state and national levels. Qualitative data input includes primary research gathered through an Online Key Informant Survey.

**PRC Community Health Survey**

*Survey Instrument*

The survey instrument used for this study is based largely on the Centers for Disease Control and Prevention (CDC) Behavioral Risk Factor Surveillance System (BRFSS), as well as various other public health surveys and customized questions addressing gaps in indicator data relative to health promotion and disease prevention objectives and other recognized health issues. The final survey instrument was developed by the Columbus Regional Hospital and PRC and is similar to the previous surveys used in the region, allowing for data trending.

**Community Defined for This Assessment**

The study area for the survey effort (referred to as the “Columbus Regional Hospital Service Area” or “CRH Service Area” in this report) includes each of the residential ZIP Codes primarily associated with Bartholomew County, Indiana, as well as ZIP Codes 47274 in Jackson County and 47265 in Jennings County. This community definition, based on the ZIP Codes of residence of recent patients of the hospital, is illustrated in the following map.
Sample Approach & Design

A precise and carefully executed methodology is critical in asserting the validity of the results gathered in the PRC Community Health Survey. Thus, to ensure the best representation of the population surveyed, a telephone interview methodology — one that incorporates both landline and cell phone interviews — was employed. The primary advantages of telephone interviewing are timeliness, efficiency, and random-selection capabilities.

The sample design used for this effort consisted of a stratified random sample of 700 individuals age 18 and older in the Columbus Regional Hospital Service Area, including 500 in Bartholomew County and 100 each in Jackson (ZIP Code 47274) and Jennings (ZIP Code 47265) counties. Once the interviews were completed, these were weighted in proportion to the actual population distribution so as to appropriately represent the Columbus Regional Hospital Service Area as a whole. All administration of the surveys, data collection and data analysis was conducted by Professional Research Consultants, Inc. (PRC).

For statistical purposes, the maximum rate of error associated with a sample size of 700 respondents is ±3.7% at the 95 percent level of confidence.
geographic distribution and demographic characteristics of the population surveyed (poststratification), so as to eliminate any naturally occurring bias. Specifically, once the raw data are gathered, respondents are examined by key demographic characteristics (namely gender, age, race, ethnicity, and poverty status) and a statistical application package applies weighting variables that produce a sample which more closely matches the population for these characteristics. Thus, while the integrity of each individual’s responses is maintained, one respondent’s responses may contribute to the whole the same weight as, for example, 1.1 respondents. Another respondent, whose demographic characteristics may have been slightly oversampled, may contribute the same weight as 0.9 respondents.

The following chart outlines the characteristics of the Columbus Regional Hospital Service Area sample for key demographic variables, compared to actual population characteristics revealed in census data. [Note that the sample consisted solely of area residents age 18 and older; data on children were given by proxy by the person most responsible for that child’s healthcare needs, and these children are not represented demographically in this chart.]

Further note that the poverty descriptions and segmentation used in this report are based on administrative poverty thresholds determined by the US Department of Health & Human Services. These guidelines define poverty status by household income level and number of persons in the household (e.g., the 2014 guidelines place the poverty threshold for a family of four at $23,850 annual household income or lower). In sample segmentation: “low income” refers to community members living in a household with defined poverty status or living just above the poverty level, earning up to twice the poverty threshold; “mid/high income” refers to those households living on incomes which are twice or more the federal poverty level.

The sample design and the quality control procedures used in the data collection ensure that
the sample is representative. Thus, the findings may be generalized to the total population of community members in the defined area with a high degree of confidence.

**Online Key Informant Survey**

To solicit input from key informants, those individuals who have a broad interest in the health of the community, an Online Key Informant Survey was also implemented as part of this process. A list of recommended participants was provided by Columbus Regional Hospital; this list included names and contact information for physicians, public health representatives, other health professionals, social service providers, and a variety of other community leaders. Potential participants were chosen because of their ability to identify primary concerns of the populations with whom they work, as well as of the community overall.

Key informants were contacted by email, introducing the purpose of the survey and providing a link to take the survey online; reminder emails were sent as needed to increase participation. In all, 104 community stakeholders took part in the Online Key Informant Survey, as outlined in the following table:

<table>
<thead>
<tr>
<th>Key Informant Type</th>
<th>Number Invited</th>
<th>Number Participating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community/Business Leaders</td>
<td>93</td>
<td>40</td>
</tr>
<tr>
<td>Other Health</td>
<td>46</td>
<td>26</td>
</tr>
<tr>
<td>Physicians</td>
<td>15</td>
<td>7</td>
</tr>
<tr>
<td>Public Health</td>
<td>36</td>
<td>24</td>
</tr>
<tr>
<td>Social Services</td>
<td>13</td>
<td>7</td>
</tr>
</tbody>
</table>

Participants included representatives of the following organizations:

- Advocates for Children
- Bartholomew Consolidated School Corporation
- Bartholomew County Community Medication Assistance
- Bartholomew County Health Board
- Bartholomew County Health Department
- BBCMA Alliance
- BCSC
- BCSC - Clifty Creek Elementary
- BCSC Elementary School
- BCSC L.F. Smith Elementary
- Centerstone
- City of Columbus
Through this process, input was gathered from several individuals whose organizations work with low-income, minority populations, or other medically underserved populations (including African-Americans, American Indians, Asian-Indians, Asians, children, the elderly, ex-
convicts, Hispanics, homeless, immigrants, Indians, the LGBT population, low-income, medically underserved, multiracial, non-English speaking, other races, single parents, addicted patients with limited social support, undereducated, undocumented, uninsured/underinsured, victims of domestic violence, and young adults), or other medically underserved populations (including children, the disabled, elderly, Hispanics, homeless, LGBT community, low-income, Medicaid/Medicare, mentally ill, single parents, substance abusers, undereducated, undocumented, uninsured/underinsured, veterans, women, young adults).

In the online survey, key informants were asked to rate the degree to which various health issues are a problem in their own community. Follow-up questions asked them to describe why they identify problem areas as such and how these might be better addressed. Results of their ratings, as well as their verbatim comments, are included throughout this report as they relate to the various other data presented.

NOTE: These findings represent qualitative rather than quantitative data. The Online Key Informant Survey was designed to gather input from participants regarding their opinions and perceptions of the health of the residents in the area. Thus, these findings are based on perceptions, not facts.

Public Health, Vital Statistics & Other Data

A variety of existing (secondary) data sources was consulted to complement the research quality of this Community Health Needs Assessment. Data for the Columbus Regional Hospital Service Area were obtained from the following sources (specific citations are included with the graphs throughout this report):

- Center for Applied Research and Environmental Systems (CARES)
- Centers for Disease Control & Prevention, Office of Infectious Disease, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention
- Centers for Disease Control & Prevention, Office of Public Health Science Services, Center for Surveillance, Epidemiology and Laboratory Services, Division of Health Informatics and Surveillance (DHIS)
- Centers for Disease Control & Prevention, Office of Public Health Science Services, National Center for Health Statistics
- Community Commons
- ESRI ArcGIS Map Gallery
- National Cancer Institute, State Cancer Profiles
- OpenStreetMap (OSM)
- US Census Bureau, American Community Survey
- US Census Bureau, County Business Patterns
- US Census Bureau, Decennial Census
- US Department of Agriculture, Economic Research Service
- US Department of Health & Human Services
Note that secondary data reflect county-level data.

**Benchmark Data**

**Trending**
A similar survey was administered in the Columbus Regional Hospital Service Area in 1996, 2000, 2003, 2006, 2009, and 2012 by PRC on behalf of Columbus Regional Hospital. Trending data, as revealed by comparison to prior survey results, are provided throughout this report whenever available. Historical data for secondary data indicators are also included for the purposes of trending.

**Indiana Risk Factor Data**
Statewide risk factor data are provided where available as an additional benchmark against which to compare local survey findings; these data are reported in the most recent *BRFSS (Behavioral Risk Factor Surveillance System) Prevalence and Trend Data* published by the Centers for Disease Control and Prevention and the US Department of Health & Human Services. State-level vital statistics are also provided for comparison of secondary data indicators.

**Nationwide Risk Factor Data**
Nationwide risk factor data, which are also provided in comparison charts, are taken from the 2013 *PRC National Health Survey*; the methodological approach for the national study is identical to that employed in this assessment, and these data may be generalized to the US population with a high degree of confidence. National-level vital statistics are also provided for comparison of secondary data indicators.

**Healthy People 2020**
Healthy People provides science-based, 10-year national objectives for improving the health of all Americans. The Healthy People initiative is grounded in the principle that setting national objectives and monitoring progress can motivate action. For three decades, Healthy People has established benchmarks and monitored progress over time in order to:

- Encourage collaborations across sectors.
- Guide individuals toward making informed health decisions.
- Measure the impact of prevention activities.

Healthy People 2020 is the product of an extensive stakeholder feedback process that is unparalleled in government and health. It integrates input from public health and prevention...
experts, a wide range of federal, state and local government officials, a consortium of more than 2,000 organizations, and perhaps most importantly, the public. More than 8,000 comments were considered in drafting a comprehensive set of Healthy People 2020 objectives.

**Determining Significance**

Differences noted in this report represent those determined to be significant. For survey-derived indicators (which are subject to sampling error), statistical significance is determined based on confidence intervals (at the 95 percent confidence level) using question-specific samples and response rates. For secondary data indicators (which do not carry sampling error, but might be subject to reporting error), “significance,” for the purpose of this report, is determined by a 5% variation from the comparative measure.

**Information Gaps**

While this assessment is quite comprehensive, it cannot measure all possible aspects of health in the community, nor can it adequately represent all possible populations of interest. It must be recognized that these information gaps might in some ways limit the ability to assess all of the community’s health needs.

For example, certain population groups — such as the homeless, institutionalized persons, or those who only speak a language other than English or Spanish — are not represented in the survey data. Other population groups — for example, pregnant women, lesbian/gay/bisexual/transgender residents, undocumented residents, and members of certain racial/ethnic or immigrant groups — might not be identifiable or might not be represented in numbers sufficient for independent analyses.

In terms of content, this assessment was designed to provide a comprehensive and broad picture of the health of the overall community. However, there are certainly a great number of medical conditions that are not specifically addressed.
IRS Form 990, Schedule H Compliance

For non-profit hospitals, a Community Health Needs Assessment (CHNA) also serves to satisfy certain requirements of tax reporting, pursuant to provisions of the Patient Protection & Affordable Care Act of 2010. To understand which elements of this report relate to those requested as part of hospitals' reporting on IRS Form 990 Schedule H, the following table cross-references related sections.

### Summary of Findings

**Significant Health Needs of the Community**

The following “areas of opportunity” represent the significant health needs of the community, based on the information gathered through this Community Health Needs Assessment and the guidelines set forth in Healthy People 2020. From these data, opportunities for health improvement exist in the area with regard to the following health issues (see also the summary tables presented in the following section).

#### Areas of Opportunity Identified Through This Assessment

**Summary Tables: Comparisons With Benchmark Data**

The following tables provide an overview of indicators in the Columbus Regional Hospital Service Area, including comparisons among the individual communities, as well as trend data. These data are grouped to correspond with the Focus Areas presented in Healthy People 2020.

**Reading the Summary Tables**

- In the following charts, Columbus Regional Hospital Service Area results are shown in the larger, blue column.

- The green columns [to the left of the service area column] provide comparisons among the three subareas, identifying differences for each as “better than” (◯), “worse than” (●), or “similar to” (≡) the combined opposing areas.

- The columns to the right of the CRH Service Area column provide trending (for Bartholomew County results), as well as comparisons between local data and any available state and national findings, and Healthy People 2020 targets. Again, symbols indicate whether the service area compares favorably (◯), unfavorably (●), or comparably (≡) to these external data.

Note that blank table cells signify that data are not available or are not reliable for that area and/or for that indicator.
<table>
<thead>

Population Characteristics

Total Population
The three counties containing Columbus Regional Hospital Service Area, the focus of this Community Health Needs Assessment, encompass 1,292.46 square miles and house a total population of 149,023 residents, according to latest census estimates.

| Total Population (Estimated Population, 2009-2013) |
|---------------------------------|-----------------|-----------------|
|                                | Total Population| Total Land Area  |
|                                |                 | (Square Miles)   |
| Bartholomew County             | 77,930          | 406.80          |
| Jennings County                | 28,324          | 376.48          |
| Jackson County                 | 42,769          | 509.18          |
| CRH Service Area               | 149,023         | 1,292.46        |
| Indiana                        | 6,514,861       | 35,816.65       |
| United States                  | 311,536,591     | 3,530,997.6     |

Population Change 2000-2010
A significant positive or negative shift in total population over time impacts healthcare providers and the utilization of community resources.

Between the 2000 and 2010 US Censuses, the population of the service area increased by 7,371 persons, or 5.3%.

- A smaller proportional increase than seen across the state.
- A smaller proportional increase than seen nationwide.
- Note, however, the larger population increase reported for Bartholomew County (7.5%).
Change in Total Population
(Percentage Change Between 2000 and 2010)

While much of the area has experienced an increase in population, note the pockets (in purple) where the population decreased between 2000 and 2010.
Urban/Rural Population

Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.

More than half of the Columbus Regional Hospital Service Area is urban (58.3% of the population lives in areas designated as urban).

- Note that at least 75% of the state and national populations live in urban areas.
- By county, Bartholomew County reports the highest proportion of urban living (66.3% of the population).

Sources: US Census Bureau Decennial Census (2010).

Notes: This indicator reports the percentage of population living in urban and rural areas. Urban areas are identified using population density, count, and size thresholds. Urban areas also include territory with a high degree of impervious surface (development). Rural areas are all areas that are not urban.

- Note the following map outlining the urban population in the Columbus Regional Hospital Service Area census tracts as of 2010.
Age

It is important to understand the age distribution of the population as different age groups have unique health needs which should be considered separately from others along the age spectrum.

In the Columbus Regional Hospital Service Area, 25.0% of the population are infants, children or adolescents (age 0-17); another 60.8% are age 18 to 64, while 14.2% are age 65 and older.

- The percentage of older adults (65+) is higher than that found statewide.
- The percentage of older adults (65+) is higher than the US figure.
- Viewed by county, Jackson County has the largest proportion of seniors.

Race & Ethnicity

Race

In looking at race independent of ethnicity (Hispanic or Latino origin), 91.6% of residents of Columbus Regional Hospital Service Area are White and 1.3% are Black.

• The state population is less White, more Black, and includes more multiple-race residents.
• Nationally, the US population is less White, more Black, and includes more multiple-race residents.
• By county, Jennings is the least racially diverse.

Notes:  
- Origin can be viewed as the heritage, nationality group, lineage, or country of birth of the person or the person's parents or ancestors before their arrival in the United States. People who identify their origin as Hispanic, Latino, or Spanish may be of any race.
The Hispanic population appears to be most concentrated in portions of Bartholomew County.

Between 2000 and 2010, the Hispanic population in the Columbus Regional Hospital Service Area increased by 4,840 people, or 166.7%.

- Twice as high (in terms of percentage growth) than found statewide.
- Nearly four times higher (in terms of percentage growth) than found nationally.

Hispanic Population Change
(Percentage Change in Hispanic Population Between 2000 and 2010)

Sources:  
**Linguistic Isolation**

A total of 2.6% of the Columbus Regional Hospital Service Area population age 5 and older live in a home in which no persons age 14 or older are proficient in English (speaking only English, or speaking English “very well”).

- Higher than found statewide.
- Lower than found nationally.
- By county, the percentage decreases to almost zero in Jennings County (the percentage is highest in Jackson County).

**Linguistically Isolated Population**

(2009-2013)

- Barolomew County: 2.8%
- Jennings County: 0.2%
- Jackson County: 3.7%
- CRH Service Area: 2.6%
- IN: 2.0%
- US: 4.8%

**Sources:**

**Notes:**
- This indicator reports the percentage of the population aged 5 and older who live in a home in which no person 14 years old and over speaks only English, or in which no person 14 years old and over speaks a non-English language and speak English “very well.”

- Note the following map illustrating linguistic isolation in the Columbus Regional Hospital Service Area.
Social Determinants of Health

About Social Determinants
Health starts in our homes, schools, workplaces, neighborhoods, and communities. We know that taking care of ourselves by eating well and staying active, not smoking, getting the recommended immunizations and screening tests, and seeing a doctor when we are sick all influence our health. Our health is also determined in part by access to social and economic opportunities; the resources and supports available in our homes, neighborhoods, and communities; the quality of our schooling; the safety of our workplaces; the cleanliness of our water, food, and air; and the nature of our social interactions and relationships. The conditions in which we live explain in part why some Americans are healthier than others and why Americans more generally are not as healthy as they could be.

- Healthy People 2020 (www.healthypeople.gov)

Poverty
The latest census estimate shows 13.3% of the Columbus Regional Hospital Service Area population living below the federal poverty level.

In all, 33.8% of Columbus Regional Hospital Service Area residents (an estimated 49,429 individuals) live below 200% of the federal poverty level.

- Comparable to the proportion reported statewide.
- Comparable to that found nationally.
- Jennings County reports the highest prevalence of residents living in poverty.

Population in Poverty
(Populations Living Below 100% and Below 200% of the Poverty Level; 2009-2013)

Sources: US Census Bureau American Community Survey 5-year estimates (2009-2013).

Notes:
- Poverty is considered a key driver of health status. This indicator is relevant because poverty creates barriers to access including health services, healthy food, and other necessities that contribute to poor health status.
The following maps provide an illustration of poverty in the service area, segmented by census tracts.
Children in Low-Income Households

Additionally, 44.2% of Columbus Regional Hospital Service Area children age 0-17 (representing nearly 16,000 children) live below the 200% poverty threshold.

- Similar to the proportion found statewide.
- Similar to the proportion found nationally.
- Unfavorably high in Jennings County.

Percent of Children in Low-Income Households
(Children 0-17 Living Below 200% of the Poverty Level, 2009-2013)

Notes: This indicator reports the percentage of children aged 0-17 living in households with income below 200% of the Federal Poverty Level (FPL). This indicator is relevant because poverty creates barriers to access including health services, healthy food, and other necessities that contribute to poor health status.

- Note the various concentrations of children in lower-income households across the service area.
Education

Among the Columbus Regional Hospital Service Area population age 25 and older, an estimated 12.5% (over 12,400 people) do not have a high school education.

- Comparable to that found statewide.
- More favorable than found nationally.
- Highest in Jennings County, lowest in Bartholomew County.

Population With No High School Diploma

(Population Age 25+ Without a High School Diploma or Equivalent, 2009-2013)

Sources:

Notes:
- This indicator is relevant because educational attainment is linked to positive health outcomes.
• Note that some areas depicted in the following map include populations (age 25+) where more than 21.0% are without a high school diploma.

Employment

According to data derived from the US Department of Labor, the unemployment rate in the Columbus Regional Hospital Service Area at the end of December 2014 was 4.8%.

• More favorable than the statewide unemployment rate.
• More favorable than the national unemployment rate.
• TREND: Unemployment for the service area has trended downward sharply since 2009, echoing the state and national trends.
Unemployment Rate
(Percent of Non-Institutionalized Population Age 16+ Unemployed, Not Seasonally-Adjusted)

Sources:

Notes:
- This indicator is relevant because unemployment creates financial instability and barriers to access including insurance coverage, health services, healthy food, and other necessities that contribute to poor health status.
General Health Status
Overall Health Status

Self-Reported Health Status

A total of 47.8% of Columbus Regional Hospital Service Area adults rate their overall health as “excellent” or “very good.”

- Another 31.1% gave “good” ratings of their overall health.

Self-Reported Health Status

Workdays Missed
Among employed adults in the service area, most (80.8%) missed fewer than 3 workdays over the past year due to personal illness.

- On the other hand, 19.2% of employed survey respondents missed 3 or more workdays in the past year due to personal illness.
- TREND: In Bartholomew County, the proportion of employed adults with 3+ days of workdays missed in the past year has decreased significantly over time.

Activity Limitations

About Disability & Health

An individual can get a disabling impairment or chronic condition at any point in life. Compared with people without disabilities, people with disabilities are more likely to:

- Experience difficulties or delays in getting the health care they need.
- Not have had an annual dental visit.
- Not have had a mammogram in past 2 years.
- Not have had a Pap test within the past 3 years.
- Not engage in fitness activities.
- Use tobacco.
- Be overweight or obese.
- Have high blood pressure.
- Experience symptoms of psychological distress.
- Receive less social-emotional support.
- Have lower employment rates.

There are many social and physical factors that influence the health of people with disabilities. The following three areas for public health action have been identified, using the International Classification of Functioning, Disability, and Health (ICF) and the three World Health Organization (WHO) principles of action for addressing health determinants.

- **Improve the conditions of daily life** by: encouraging communities to be accessible so all can live in, move through, and interact with their environment; encouraging community living; and removing barriers in the environment using both physical universal design concepts and operational policy shifts.
- **Address the inequitable distribution of resources among people with disabilities and those without disabilities** by increasing: appropriate health care for people with disabilities; education and work opportunities; social participation; and access to needed technologies and assistive supports.
- **Expand the knowledge base and raise awareness about determinants of health for people with disabilities** by increasing: the inclusion of people with disabilities in public health data collection efforts across the lifespan; the inclusion of people with disabilities in health promotion activities; and the expansion of disability and health training opportunities for public health and health care professionals.

- Healthy People 2020 (www.healthypeople.gov)

A total of 24.5% of Columbus Regional Hospital Service Area adults are limited in some way in some activities due to a physical, mental or emotional problem.

- Less favorable than the prevalence statewide.
- Similar to the national prevalence.
- Similar findings by county.
- **TREND:** The prevalence of activity limitations is statistically unchanged over time.
Limited in Activities in Some Way Due to a Physical, Mental or Emotional Problem

In looking at responses by key demographic characteristics, note the following:

- Adults age 40 and older are much more often limited in activities (note the positive correlation with age).
- Residents in households with lower incomes are more likely than those with higher incomes to report activity limitations.

Mental Health

About Mental Health & Mental Disorders

Mental health is a state of successful performance of mental function, resulting in productive activities, fulfilling relationships with other people, and the ability to adapt to change and to cope with challenges. Mental health is essential to personal well-being, family and interpersonal relationships, and the ability to contribute to community or society. Mental disorders are health conditions that are characterized by alterations in thinking, mood, and/or behavior that are associated with distress and/or impaired functioning. Mental disorders contribute to a host of problems that may include disability, pain, or death. Mental illness is the term that refers collectively to all diagnosable mental disorders. Mental disorders are among the most common causes of disability. The resulting disease burden of mental illness is among the highest of all diseases.

Mental health and physical health are closely connected. Mental health plays a major role in people’s ability to maintain good physical health. Mental illnesses, such as depression and anxiety, affect people’s ability to participate in health-promoting behaviors. In turn, problems with physical health, such as chronic diseases, can have a serious impact on mental health and decrease a person’s ability to participate in treatment and recovery.

The existing model for understanding mental health and mental disorders emphasizes the interaction of social, environmental, and genetic factors throughout the lifespan. In behavioral health, researchers identify: risk factors, which predispose individuals to mental illness; and protective factors, which protect them from developing mental disorders. Researchers now know that the prevention of mental, emotional, and behavioral (MEB) disorders is inherently interdisciplinary and draws on a variety of different strategies. Over the past 20 years, research on the prevention of mental disorders has progressed. The major areas of progress include evidence that:

- MEB disorders are common and begin early in life. The greatest opportunity for prevention is among young people.
- There are multiyear effects of multiple preventive interventions on reducing substance abuse, conduct disorder, antisocial behavior, aggression, and child maltreatment.
- The incidence of depression among pregnant women and adolescents can be reduced.
- School-based violence prevention can reduce the base rate of aggressive problems in an average school by 25 to 33%.
- There are potential indicated preventive interventions for schizophrenia.
- Improving family functioning and positive parenting can have positive outcomes on mental health and can reduce poverty-related risk.
- School-based preventive interventions aimed at improving social and emotional outcomes can also improve academic outcomes.
- Interventions targeting families dealing with adversities, such as parental depression or divorce, can be effective in reducing risk for depression in children and increasing effective parenting.
- Some preventive interventions have benefits that exceed costs, with the available evidence strongest for early childhood interventions.
- Implementation is complex, it is important that interventions be relevant to the target audiences.
- In addition to advancements in the prevention of mental disorders, there continues to be steady progress in treating mental disorders as new drugs and stronger evidence-based outcomes become available.

- Healthy People 2020 (www.healthypeople.gov)
Self-Reported Mental Health Status

A total of 56.7% of Columbus Regional Hospital Service Area adults rate their overall mental health as “excellent” or “very good.”

- Another 27.7% gave “good” ratings of their own mental health status.

Depression

Diagnosed Depression
A total of 26.9% of Columbus Regional Hospital Service Area adults have been diagnosed by a physician as having a depressive disorder (such as depression, major depression, dysthymia, or minor depression).

• Worse than the national finding.
• Statistically similar by county.
The prevalence of diagnosed depression is notably higher among:

- Women.
- Adults under age 65.
- Community members living at lower incomes.
Symptoms of Chronic Depression

A total of 31.3% of Columbus Regional Hospital Service Area adults have had two or more years in their lives when they felt depressed or sad on most days, although they may have felt okay sometimes (symptoms of chronic depression).

- Similar to national findings.
- Statistically similar findings by county.
- TREND: Denotes a statistically significant increase in the Columbus Regional Hospital Service Area since 1996.

Have Experienced Symptoms of Chronic Depression

Note that the prevalence of chronic depression is notably higher among:

- Women.
- Adults with lower incomes.

Notes: Asked of all respondents.
Chronic depression includes periods of two or more years during which the respondent felt depressed or sad on most days, even if (s)he felt okay sometimes.
Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

Suicide
Between 2011 and 2013, there was an annual average age-adjusted suicide rate of 14.4 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Comparable to the statewide rate.
- Higher than the national rate.
- Fails to satisfy the Healthy People 2020 target of 10.2 or lower.
- The rate was 16.0 in Bartholomew County.

**Challenges**
Among those rating this issue as a “major problem,” the following represent what key informants see as the main challenges for persons with mental illness:

**Availability of Resources**
Just seeing a doctor can be challenging. So many mental health issues and not enough doctors to treat them. Many mental health disorders not being diagnosed or treated. Many mental health
problems in the low income people yet no doctors to see that they can afford. Length of time to see a doctor for the first time is too long. – Public Health

There is only one inpatient treatment facility and one outpatient center. There are no specific treatment centers for all of the many individuals battling prescription drug addictions. – Other Health

Facilities for persons with addictions, especially young people. – Community/Business Leaders

Very few facilities and programs to address high needs. – Public Health

Lack of funding to provide comprehensive mental health services and lack of insight into the need for expanded services. – Public Health

Lack of inpatient bed space for those in need. No pediatric psychiatric services within the area. Patients are being transferred out of county. – Other Health

Lack of resources available to address it. Social stigma about discussing it. – Social Services

Very little counseling available, generally just want to prescribe medications. – Other Health

Disconnect from inpatient hospitalization and outpatient services. Large population of patients with multiple factors, limited resources. Poor patient compliance. Limited providers, resources. Community stigma of diseases. Drug abuse. – Other Health

Access to Care

Lack of access to psychiatric care. Psychiatrists can take months to get into so if you can get a referral from your mental health provider. – Other Health

Access. – Other Health

Access to mental health providers, access to effective substance abuse programs, incarceration of persons with mental illness. No other place for them to go and no on-going treatment. Social stigma keeps some from seeking help. – Physicians

Access to counselors and psychiatrists is a major hurdle in this community. Wait lists for appointments can be lengthy and with a high rate of Medicaid patients the wait can be even longer. – Physicians

Affordable access, psychiatric and psychological specialty care, timely access. – Physicians

Lack of affordable long term mental health treatment which causes a yo-yo effect. – Community/Business Leaders

Lack of affordable providers for neediest clients. – Other Health

Affordable immediate access to care. – Community/Business Leaders

Stigma

Stigma associated with MH. Needs to be integrated with Primary Care. – Other Health

Stigma. Lack of providers. Cuts in funding for those with chronic conditions. New agencies coming to the community who may be looking for profits yet there are few established guidelines for care as chronic care and home based care. – Community/Business Leaders

There is a stigma attached to mental health. People won’t admit to needing help. There are limits to mental resources on most health plans. – Community/Business Leaders

After-Care Assistance

After-care assistance after diagnosis, it is just not there. Unless you have a dire emergency and go to the ER for emergency evaluation. Families work hard and struggle to find the help, it is very lacking at best. – Public Health

Reintroduction back into the pre-existing environment, outpatient community resources. – Other Health

At-Risk Populations

There appears to be a great deal of mental health issues in the at risk populations. Cost, lack of information, lack of support systems are all factors. – Community/Business Leaders

Prevalence

In my scope of practice, I have many students and members of their family who need counseling and take medications related to mental illness. – Public Health

Under-diagnoses

This issue tends to be one of under diagnosis or more appropriately one of not seeking the proper medical help, probably due to social stigmas attached to the mental health topics. – Community/Business Leaders
Death, Disease & Chronic Conditions
Leading Causes of Death

Distribution of Deaths by Cause
Together, cardiovascular disease (heart disease and stroke) and cancers accounted for one-half of all deaths in the service area in 2013.

Leading Causes of Death
(Columbus Regional Hospital Service Area, 2013)

Sources: CDC WONDER Online Query System, Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted June 2015.
Notes: Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
CLRD is chronic lower respiratory disease.

Age-Adjusted Death Rates for Selected Causes

In order to compare mortality in the region with other localities (in this case, Indiana and the United States), it is necessary to look at rates of death — these are figures which represent the number of deaths in relation to the population size (such as deaths per 100,000 population, as is used here).

Furthermore, in order to compare localities without undue bias toward younger or older populations, the common convention is to adjust the data to some common baseline age distribution. Use of these “age-adjusted” rates provides the most valuable means of gauging mortality against benchmark data, as well as Healthy People 2020 targets.

The following chart outlines 2011-2013 annual average age-adjusted death rates per 100,000 population for selected causes of death in the Columbus Regional Hospital Service Area.

Note that age-adjusted mortality rates in the service area are worse than national rates for suicide, stroke, cancer, CLRD (chronic lower respiratory disease), unintentional injuries (including motor vehicle accidents), Alzheimer’s disease, kidney disease, cirrhosis, and drug-related deaths.
Of the causes outlined in the following chart for which Healthy People 2020 objectives have been established, Columbus Regional Hospital Service Area rates fail to satisfy the related goals for suicide, stroke, cancer, unintentional injuries (including motor vehicle accidents), cirrhosis, and drug-related deaths.

- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population and coded using ICD-10 codes.
- The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart; the Diabetes target is adjusted to reflect only diabetes mellitus-coded deaths.
Cardiovascular Disease

About Heart Disease & Stroke
Heart disease is the leading cause of death in the United States, with stroke following as the third leading cause. Together, heart disease and stroke are among the most widespread and costly health problems facing the nation today, accounting for more than $500 billion in healthcare expenditures and related expenses in 2010 alone. Fortunately, they are also among the most preventable.

The leading modifiable (controllable) risk factors for heart disease and stroke are:
- High blood pressure
- High cholesterol
- Cigarette smoking
- Diabetes
- Poor diet and physical inactivity
- Overweight and obesity

The risk of Americans developing and dying from cardiovascular disease would be substantially reduced if major improvements were made across the US population in diet and physical activity, control of high blood pressure and cholesterol, smoking cessation, and appropriate aspirin use.

The burden of cardiovascular disease is disproportionately distributed across the population. There are significant disparities in the following based on gender, age, race/ethnicity, geographic area, and socioeconomic status:
- Prevalence of risk factors
- Access to treatment
- Appropriate and timely treatment
- Treatment outcomes
- Mortality

Disease does not occur in isolation, and cardiovascular disease is no exception. Cardiovascular health is significantly influenced by the physical, social, and political environment, including: maternal and child health; access to educational opportunities; availability of healthy foods, physical education, and extracurricular activities in schools; opportunities for physical activity, including access to safe and walkable communities; access to healthy foods; quality of working conditions and worksite health; availability of community support and resources; and access to affordable, quality healthcare.

Age-Adjusted Heart Disease & Stroke Deaths

Heart Disease Deaths
Between 2011 and 2013 there was an annual average age-adjusted heart disease mortality rate of 178.6 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Similar to the statewide rate.
- Similar to the national rate.
- Fails to satisfy the Healthy People 2020 target of 156.9 or lower (as adjusted to account for all diseases of the heart).
- Favorably low in Bartholomew County.
Heart Disease: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 156.9 or Lower (Adjusted)

- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
- The Healthy People 2020 Heart Disease target is adjusted to account for all diseases of the heart.
**Stroke Deaths**

*Between 2011 and 2013, there was an annual average age-adjusted stroke mortality rate of 49.9 deaths per 100,000 population in the Columbus Regional Hospital Service Area.*

- Less favorable than the Indiana rate.
- Less favorable than the national rate.
- Fails to satisfy the Healthy People 2020 target of 34.8 or lower.
- Lower in Bartholomew County.

Cardiovascular Risk Factors

About Cardiovascular Risk

Controlling risk factors for heart disease and stroke remains a challenge. High blood pressure and cholesterol are still major contributors to the national epidemic of cardiovascular disease. High blood pressure affects approximately 1 in 3 adults in the United States, and more than half of Americans with high blood pressure do not have it under control. High sodium intake is a known risk factor for high blood pressure and heart disease, yet about 90% of American adults exceed their recommendation for sodium intake.

- Healthy People 2020 (www.healthypeople.gov)

Hypertension (High Blood Pressure)

Prevalence of Hypertension

A total of 40.4% of adults have been told at some point that their blood pressure was high.

- Less favorable than the Indiana prevalence.
- Less favorable than the national prevalence.
- Far from satisfying the Healthy People 2020 target (26.9% or lower).
- Similar findings by county.
- TREND: Denotes a statistically significant increase since 1996.
- Among hypertensive adults, 76.6% have been diagnosed with high blood pressure more than once.

Prevalence of High Blood Pressure

Healthy People 2020 Target = 26.9% or Lower

- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

### Hypertension Management

Among respondents who have been told that their blood pressure was high, 91.4% report that they are currently taking actions to control their condition.

- Similar to national findings.
- The prevalence is 92.7% in Bartholomew County.
Taking Action to Control Hypertension
(Among CRH Service Area Adults With High Blood Pressure; 2015)

Bartholomew County: 92.7%
CRH Service Area: 91.4%
US: 89.2%

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 44]
2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
• Asked of all respondents who have been diagnosed with high blood pressure.
• In this case, the term “action” refers to medication, change in diet, and/or exercise.

High Blood Cholesterol
Self-Reported High Blood Cholesterol

A total of 31.6% of adults have been told by a health professional that their cholesterol level was high.

• More favorable than the Indiana findings.
• Similar to the national prevalence.
• Fails to satisfy the Healthy People 2020 target (13.5% or lower).
• Similar findings by county.
• TREND: Statistically unchanged since 1996.
Prevalence of High Blood Cholesterol
Healthy People 2020 Target = 13.5% or Lower

Sources:
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 46]

Notes:
- Asked of all respondents.
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

Further note the following:
- There is a positive correlation between age and high blood cholesterol.
About Cardiovascular Risk

Individual level risk factors which put people at increased risk for cardiovascular diseases include:

- High Blood Pressure
- High Blood Cholesterol
- Tobacco Use
- Physical Inactivity
- Poor Nutrition
- Overweight/Obesity
- Diabetes

Three health-related behaviors contribute markedly to cardiovascular disease:

**Poor nutrition.** People who are overweight have a higher risk for cardiovascular disease. Almost 60% of adults are overweight or obese. To maintain a proper body weight, experts recommend a well-balanced diet which is low in fat and high in fiber, accompanied by regular exercise.

**Lack of physical activity.** People who are not physically active have twice the risk for heart disease of those who are active. More than half of adults do not achieve recommended levels of physical activity.

**Tobacco use.** Smokers have twice the risk for heart attack of non-smokers. Nearly one-fifth of all deaths from cardiovascular disease, or about 190,000 deaths a year nationally, are smoking-related. Every day, more than 3,000 young people become daily smokers in the US.

Modifying these behaviors is critical both for preventing and for controlling cardiovascular disease. Other steps that adults who have cardiovascular disease should take to reduce their risk of death and disability include adhering to treatment for high blood pressure and cholesterol, using aspirin as appropriate, and learning the symptoms of heart attack and stroke.

**Total Cardiovascular Risk**

A total of 87.5% of Columbus Regional Hospital Service Area adults report one or more cardiovascular risk factors, such as being overweight, smoking cigarettes, being physically inactive, or having high blood pressure or cholesterol.

- Higher than national findings.
- Unfavorably high in Jennings and Jackson counties.
- TREND: Statistically similar to the 1996 findings.
Adults more likely to exhibit cardiovascular risk factors include:

- Men.
- Adults age 40 and older, and especially seniors.
- Lower-income residents.
Key Informant Input: Heart Disease & Stroke

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Education & Early Detection

- Diet and risk factors, more education is needed. – Public Health
  I believe heart disease and stroke can be deadly diseases. Often early detection of cardiovascular disease is a preventative and treatment involves medication, change in nutrition, and exercise. Access to costly treatments may be a deterrent for treatment, also women may also not understand their risks and take the necessary precautions. – Community/Business Leaders
  Within my scope of practice I take daily blood pressures and discuss daily cholesterol and heart medications that are taken by my faculty. I have three faculty members with confirmed diagnosis of serious heart conditions. – Public Health
  Increased number of men and women having AMI’s at much younger age. Education regarding the signs and symptoms of stroke. – Other Health
  Due to the past life style behaviors and lack of understanding the damage tobacco and unhealthy diets could cause was not learned. The older the person the more difficult to encourage change is lifestyle and dietary habits. – Other Health

Obesity & Behavioral Risks

- Indiana is one of the top ten states for tobacco use and obesity. Two huge risk factors for heart disease and stroke. Culturally, Indiana has not adopted healthy lifestyle changes. – Other Health
- Large prevalence of overweight, obesity, tobacco use and inactivity. – Public Health
- Heart disease and strokes may be the results of unhealthy eating and exercise habits. The average life expectancy has increased and these two illnesses impact the elderly more frequently. Do we have affordable resources for our aging population to get assistance? – Community/Business Leaders

Quality of Life

- These conditions severely limit activities and quality of life. Maintenance of heart diseases is costly for many of our clients. – Social Services
Cancer

About Cancer

Continued advances in cancer research, detection, and treatment have resulted in a decline in both incidence and death rates for all cancers. Among people who develop cancer, more than half will be alive in five years. Yet, cancer remains a leading cause of death in the United States, second only to heart disease.

Many cancers are preventable by reducing risk factors such as: use of tobacco products; physical inactivity and poor nutrition; obesity; and ultraviolet light exposure. Other cancers can be prevented by getting vaccinated against human papillomavirus and hepatitis B virus. In the past decade, overweight and obesity have emerged as new risk factors for developing certain cancers, including colorectal, breast, uterine corpus (endometrial), and kidney cancers. The impact of the current weight trends on cancer incidence will not be fully known for several decades. Continued focus on preventing weight gain will lead to lower rates of cancer and many chronic diseases.

Screening is effective in identifying some types of cancers (see US Preventive Services Task Force [USPSTF] recommendations), including:

- Breast cancer (using mammography)
- Cervical cancer (using Pap tests)
- Colorectal cancer (using fecal occult blood testing, sigmoidoscopy, or colonoscopy)
- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Cancer Deaths

All Cancer Deaths

Between 2011 and 2013, there was an annual average age-adjusted cancer mortality rate of 196.8 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Worse than the statewide rate.
- Worse than the national rate.
- Fails to satisfy the Healthy People 2020 target of 161.4 or lower.
- Highest in Jackson County, lowest in Bartholomew.
Cancer: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 161.4 or Lower

Sources:  
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted June 2015.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.

- TREND: Cancer mortality has decreased slightly over the past decade in the Columbus Regional Hospital Service Area; the same trend is apparent both statewide and nationwide.

Notes:
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
Cancer Deaths by Site

Lung cancer is by far the leading cause of cancer deaths in the Columbus Regional Hospital Service Area.

Other leading sites include prostate cancer among men, breast cancer among women, and colorectal cancer (both genders).

As can be seen in the following chart (referencing 2011-2013 annual average age-adjusted death rates):

- The Columbus Regional Hospital Service Area lung and prostate cancer death rates are worse than both the state and national rates.
- The service area female breast and colorectal cancer death rates are both comparable to the Indiana rates but worse than the US rates.

Note that each of the Columbus Regional Hospital Service Area cancer death rates detailed below fails to satisfy the related Healthy People 2020 target.

### Age-Adjusted Cancer Death Rates by Site

Cancer Incidence

Incidence rates reflect the number of newly diagnosed cases in a given population in a given year, regardless of outcome. Here, these rates are also age-adjusted.

Between 2007 and 2011, the CRH Service Area had an annual average age-adjusted incidence rate of 117.2 female breast cancer cases per 100,000 population.

- Similar to the statewide incidence rate.
• Similar to the national incidence rate.

The service area reported an annual average age-adjusted incidence rate of prostate cancer of 103.0 cases per 100,000 population.
  • Better than the statewide incidence rate.
  • Better than the national incidence rate.

The CRH Service Area reported an annual average age-adjusted incidence rate of 82.5 lung cancer cases per 100,000 population.
  • Worse than the statewide incidence rate.
  • Worse than the national incidence rate.

There was an annual average age-adjusted incidence rate of colorectal cancer of 42.2 cases per 100,000 in the area.
  • Better than the statewide incidence rate.
  • Close to the national incidence rate.

There was an annual average age-adjusted incidence rate of cervical cancer of 9.0 cases per 100,000 in the Columbus Regional Hospital Service Area.
  • Worse than the statewide incidence rate.
  • Worse than the national incidence rate.

Sources: State Cancer Profiles; 2007-11.

Notes: This indicator reports the age-adjusted incidence rate (cases per 100,000 population per year) of cancers, adjusted to 2000 US standard population age groups (under age 1, 1-4, 5-9, ... 80-84, 85 and older). This indicator is relevant because cancer is a leading cause of death and it is important to identify cancers separately to better target interventions.
Prevalence of Cancer

Skin Cancer
A total of 7.3% of surveyed CRH Service Area adults report having been diagnosed with skin cancer.

- Similar to what is found statewide.
- Similar to the national average.
- Similar findings by county.
- TREND: The prevalence of skin cancer has remained statistically unchanged over time.

Other Cancer
A total of 6.4% of respondents have been diagnosed with some type of (non-skin) cancer.

- Comparable to the statewide prevalence.
- Comparable to the national prevalence.
- Comparable findings by county.
- TREND: The prevalence of cancer has remained unchanged over time.
Prevalence of Cancer (Other Than Skin Cancer)

Notes:
- Asked of all respondents.

Cancer Risk

About Cancer Risk
Reducing the nation’s cancer burden requires reducing the prevalence of behavioral and environmental factors that increase cancer risk.

- All cancers caused by cigarette smoking could be prevented. At least one-third of cancer deaths that occur in the United States are due to cigarette smoking.
- According to the American Cancer Society, about one-third of cancer deaths that occur in the United States each year are due to nutrition and physical activity factors, including obesity.
- National Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control and Prevention

Cancer Screenings
The American Cancer Society recommends that both men and women get a cancer-related checkup during a regular doctor’s checkup. It should include examination for cancers of the thyroid, testicles, ovaries, lymph nodes, oral cavity, and skin, as well as health counseling about tobacco, sun exposure, diet and nutrition, risk factors, sexual practices, and environmental and occupational exposures.

Screening levels in the community were measured in the PRC Community Health Survey relative to three cancer sites: female breast cancer (mammography and breast exams); cervical cancer (Pap smear testing); and colorectal cancer (sigmoidoscopy and fecal occult blood testing).
Female Breast Cancer Screening

About Screening for Breast Cancer

The US Preventive Services Task Force (USPSTF) recommends screening mammography, with or without clinical breast examination (CBE), every 1-2 years for women age 40 and older.

Rationale: The USPSTF found fair evidence that mammography screening every 12-33 months significantly reduces mortality from breast cancer. Evidence is strongest for women age 50-69, the age group generally included in screening trials. For women age 40-49, the evidence that screening mammography reduces mortality from breast cancer is weaker, and the absolute benefit of mammography is smaller, than it is for older women. Most, but not all, studies indicate a mortality benefit for women undergoing mammography at ages 40-49, but the delay in observed benefit in women younger than 50 makes it difficult to determine the incremental benefit of beginning screening at age 40 rather than at age 50.

The absolute benefit is smaller because the incidence of breast cancer is lower among women in their 40s than it is among older women. The USPSTF concluded that the evidence is also generalizable to women age 70 and older (who face a higher absolute risk for breast cancer) if their life expectancy is not compromised by comorbid disease. The absolute probability of benefits of regular mammography increase along a continuum with age, whereas the likelihood of harms from screening (false-positive results and unnecessary anxiety, biopsies, and cost) diminish from ages 40-70. The balance of benefits and potential harms, therefore, grows more favorable as women age. The precise age at which the potential benefits of mammography justify the possible harms is a subjective choice. The USPSTF did not find sufficient evidence to specify the optimal screening interval for women age 40-49.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

Mammography

Among women age 50-74, 73.4% have had a mammogram within the past two years.

- Similar to statewide findings (which represent all women 50+).
- Much lower than national findings.
- Fails to satisfy the Healthy People 2020 target (81.1% or higher).
- The prevalence in Bartholomew County is 71.5%.
- Among women 40+, 72.6% have had a mammogram in the past two years.
- TREND: Statistically unchanged over time.

**Notes:** Asked of all female respondents.
Cervical Cancer Screenings

About Screening for Cervical Cancer

The US Preventive Services Task Force (USPSTF) strongly recommends screening for cervical cancer in women who have been sexually active and have a cervix.

Rationale: The USPSTF found good evidence from multiple observational studies that screening with cervical cytology (Pap smears) reduces incidence of and mortality from cervical cancer. Direct evidence to determine the optimal starting and stopping age and interval for screening is limited. Indirect evidence suggests most of the benefit can be obtained by beginning screening within 3 years of onset of sexual activity or age 21 (whichever comes first) and screening at least every 3 years. The USPSTF concludes that the benefits of screening substantially outweigh potential harms.

The USPSTF recommends against routinely screening women older than age 65 for cervical cancer if they have had adequate recent screening with normal Pap smears and are not otherwise at high risk for cervical cancer.

Rationale: The USPSTF found limited evidence to determine the benefits of continued screening in women older than 65. The yield of screening is low in previously screened women older than 65 due to the declining incidence of high-grade cervical lesions after middle age. There is fair evidence that screening women older than 65 is associated with an increased risk for potential harms, including false-positive results and invasive procedures. The USPSTF concludes that the potential harms of screening are likely to exceed benefits among older women who have had normal results previously and who are not otherwise at high risk for cervical cancer.

The USPSTF recommends against routine Pap smear screening in women who have had a total hysterectomy for benign disease.

Rationale: The USPSTF found fair evidence that the yield of cytologic screening is very low in women after hysterectomy and poor evidence that screening to detect vaginal cancer improves health outcomes. The USPSTF concludes that potential harms of continued screening after hysterectomy are likely to exceed benefits.

Pap Smear Testing

Among women age 21 to 65, 79.4% have had a Pap smear within the past three years.

- Higher than Indiana findings (which represents all women 18+).
- Comparable to national findings.
- Fails to satisfy the Healthy People 2020 target (93% or higher).
- In Bartholomew County, the prevalence is 78.0% of women age 21-65.
- TREND: Marks a statistically significant decrease in Bartholomew County since 2009.
### Have Had a Pap Smear in the Past Three Years

**Notes:**
- Reflects female respondents age 21 to 65.
- *Note that the Indiana percentage represents all women age 18 and older.

### Colorectal Cancer Screenings

**About Screening for Colorectal Cancer**

The USPSTF recommends screening for colorectal cancer using fecal occult blood testing, sigmoidoscopy, or colonoscopy in adults, beginning at age 50 years and continuing until age 75 years.

The evidence is convincing that screening for colorectal cancer with fecal occult blood testing, sigmoidoscopy, or colonoscopy detects early-stage cancer and adenomatous polyps. There is convincing evidence that screening with any of the three recommended tests (FOBT, sigmoidoscopy, colonoscopy) reduces colorectal cancer mortality in adults age 50 to 75 years. Follow-up of positive screening test results requires colonoscopy regardless of the screening test used.

Note that other organizations (e.g., American Cancer Society, American Academy of Family Physicians, American College of Physicians, National Cancer Institute) may have slightly different screening guidelines.

### Colorectal Cancer Screening

Among adults age 50–75, 73.6% have had an appropriate colorectal cancer screening (fecal occult blood testing within the past year and/or sigmoidoscopy/colonoscopy [lower endoscopy] within the past 10 years).

- Similar to national findings.
- Similar to the Healthy People 2020 target (70.5% or higher).
- Similar findings by county.
- Statistically unchanged since 2012.
COMMUNITY HEALTH NEEDS ASSESSMENT

Have Had a Colorectal Cancer Screening
(Among Adults Age 50-75)
Healthy People 2020 Target = 70.5% or Higher

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 133]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents age 50 through 75.
- In this case, the term “colorectal screening” refers to adults age 50-75 receiving a FOBT (fecal occult blood test) in the past year and/or a lower endoscopy (sigmoidoscopy/colonoscopy) in the past 10 years.

Lower Endoscopy
Among adults age 50 and older, just over three-quarters (76.7%) have had a lower endoscopy (sigmoidoscopy or colonoscopy) at some point in their lives.

- More favorable than Indiana findings.
- Comparable to national findings.
- Comparable findings by country.
- TREND: Marks a statistically significant increase over time.

Have Ever Had a Lower Endoscopy Exam
(Among Adults 50+)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 131]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
-Asked of respondents age 50 and older.
- Lower endoscopy includes either sigmoidoscopy or colonoscopy.
**Blood Stool Testing**

Among adults age 50 and older, 31.6% have had a blood stool test (aka “fecal occult blood test”) within the past two years.

- Better than Indiana findings.
- Similar to national findings.
- Similar findings by county.
- TREND: Denotes a statistically significant decrease since 1996.

### Have Had a Blood Stool Test in the Past Two Years
**(Among Adults 50+)**

**Key Informant Input: Cancer**

Most key informants taking part in an online survey characterized Cancer as a “moderate problem” in the community.

**Perceptions of Cancer as a Problem in the Community**
**(Key Informants, 2014)**

- **Major Problem**: 22.1%
- **Moderate Problem**: 51.0%
- **Minor Problem**: 22.1%
- **No Problem At All**: 4.8%

**Sources:**
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 132]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

**Notes:**
- Asked of respondents age 50 and older.
- Lower endoscopy includes either sigmoidoscopy or colonoscopy.
Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Tobacco Use**

*Because of excessive tobacco use, especially by youth and young adults. There is significant use by the persons who work here, but we’re raised in foreign countries. – Community/Business Leaders*

*Heavy smoking and obesity population. – Other Health*

**High Occurrence**

*More people are being treated for cancer and it is being found more often. – Community/Business Leaders*

*There are numerous cases of breast cancer, lung cancer and others made public by church reported by prayer requests and publicly by request for fundraising for specific cases and cancer treatment in general. – Other Health*

**Preventive Screenings**

*Cancer is an ongoing threat to all of our bodies. Routine screening can be expensive and I’m not sure how many people actually take advantage of routine prevention and screenings. New treatments are available and it is important to make sure our citizens, especially in rural areas, are aware of them and have access to the best medication possible. – Community/Business Leaders*
Respiratory Disease

About Asthma & COPD

Asthma and chronic obstructive pulmonary disease (COPD) are significant public health burdens. Specific methods of detection, intervention, and treatment exist that may reduce this burden and promote health.

Asthma is a chronic inflammatory disorder of the airways characterized by episodes of reversible breathing problems due to airway narrowing and obstruction. These episodes can range in severity from mild to life threatening. Symptoms of asthma include wheezing, coughing, chest tightness, and shortness of breath. Daily preventive treatment can prevent symptoms and attacks and enable individuals who have asthma to lead active lives.

COPD is a preventable and treatable disease characterized by airflow limitation that is not fully reversible. The airflow limitation is usually progressive and associated with an abnormal inflammatory response of the lung to noxious particles or gases (typically from exposure to cigarette smoke). Treatment can lessen symptoms and improve quality of life for those with COPD.

The burden of respiratory diseases affects individuals and their families, schools, workplaces, neighborhoods, cities, and states. Because of the cost to the healthcare system, the burden of respiratory diseases also falls on society; it is paid for with higher health insurance rates, lost productivity, and tax dollars. Annual healthcare expenditures for asthma alone are estimated at $20.7 billion.

Asthma. The prevalence of asthma has increased since 1980. However, deaths from asthma have decreased since the mid-1990s. The causes of asthma are an active area of research and involve both genetic and environmental factors.

Risk factors for asthma currently being investigated include:

- Having a parent with asthma
- Sensitization to irritants and allergens
- Respiratory infections in childhood
- Overweight

Asthma affects people of every race, sex, and age. However, significant disparities in asthma morbidity and mortality exist, in particular for low-income and minority populations. Populations with higher rates of asthma include: children; women (among adults) and boys (among children); African Americans; Puerto Ricans; people living in the Northeast United States; people living below the Federal poverty level; and employees with certain exposures in the workplace.

While there is not a cure for asthma yet, there are diagnoses and treatment guidelines that are aimed at ensuring that all people with asthma live full and active lives.

- Healthy People 2020 (www.healthypeople.gov)

[NOTE: COPD was changed to chronic lower respiratory disease (CLRD) with the introduction of ICD-10 codes. CLRD is used in vital statistics reporting, but COPD is still widely used and commonly found in surveillance reports.]
Age-Adjusted Respiratory Disease Deaths

Chronic Lower Respiratory Disease Deaths (CLRD)

Between 2011 and 2013, there was an annual average age-adjusted CLRD mortality rate of 67.1 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Worse than found statewide.
- Worse than the national rate.
- Highest in Jennings County, lowest in Jackson County.

CLRD: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)

Note: COPD was changed to chronic lower respiratory disease (CLRD) in 1999 with the introduction of ICD-10 codes. CLRD is used in vital statistics reporting, but COPD is still widely used and commonly found in surveillance reports.

- TREND: CLRD mortality in the service area increased in the mid- to late-2000s, but has not since shown a clear trend.
CLRD: Age-Adjusted Mortality Trends
(Annual Average Deaths per 100,000 Population)

**Chronic Obstructive Pulmonary Disease (COPD)**

A total of 12.7% of Columbus Regional Hospital Service Area adults suffer from chronic obstructive pulmonary disease (COPD, including emphysema and bronchitis).

- Higher than the state prevalence.
- Higher than the national prevalence.
- Statistically similar findings by county.
- NOTE: in prior data, this question was asked slightly differently; respondents were asked if they had ever been diagnosed with “chronic lung disease, including bronchitis or emphysema,” rather than “COPD or chronic obstructive pulmonary disease, including bronchitis or emphysema” as is asked currently.

TREND: In comparing to 1996 data, the change in prevalence is statistically significant (an increase over time).
Prevalence of Chronic Obstructive Pulmonary Disease (COPD)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 25]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Includes those having ever suffered from or been diagnosed with COPD or chronic obstructive pulmonary disease, including bronchitis or emphysema.
- In prior data, the term “chronic lung disease” was used, which also included bronchitis or emphysema.

Asthma

Adults

A total of 18.5% of service area adults have been diagnosed with asthma.

- Similar to the statewide prevalence.
- Similar to the national prevalence.
- Statistically similar by county.
- TREND: The prevalence of adults who have been diagnosed with asthma has increased significantly since 1996.
The following adults are more likely to have been diagnosed with asthma:

- Women.
- Low-income residents.
Key Informant Input: Respiratory Disease

The greatest share of key informants taking part in an online survey characterized Respiratory Disease as a “moderate problem” in the community.

Notes: Asked of all respondents.

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

High Occurrence
- We have a high rate of asthma and COPD. – Physicians
- Increase in number of people experiencing respiratory problems. – Community/Business Leaders

Tobacco Use
- Smoking is a major factor in Respiratory health. High cost of medications is also an issue for many.
- Ration of these medications and continued smoking results in crisis and increased overall cost on the healthcare system. I see this across all socioeconomic groups. Another factor is limited providers in areas. – Other Health
- The understanding of the damage of tobacco to our lungs was not learned until many of our senior citizens had already been smoking for many years. There may also have been environmental hazards that have caused lung disease. – Other Health

Education
- High number of requests for assistance with respiratory medications. High number of clients we see with SSD secondary to COPD. – Other Health

Quality of Life
- These conditions severely limit activities and quality of life. Maintenance of respiratory diseases is costly for many of our clients. – Social Services
Injury & Violence

About Injury & Violence

Injuries and violence are widespread in society. Both unintentional injuries and those caused by acts of violence are among the top 15 killers for Americans of all ages. Many people accept them as “accidents,” “acts of fate,” or as “part of life.” However, most events resulting in injury, disability, or death are predictable and preventable.

Injuries are the leading cause of death for Americans ages 1 to 44, and a leading cause of disability for all ages, regardless of sex, race/ethnicity, or socioeconomic status. More than 180,000 people die from injuries each year, and approximately 1 in 10 sustains a nonfatal injury serious enough to be treated in a hospital emergency department.

Beyond their immediate health consequences, injuries and violence have a significant impact on the well-being of Americans by contributing to:

- Premature death
- Disability
- Poor mental health
- High medical costs
- Lost productivity

The effects of injuries and violence extend beyond the injured person or victim of violence to family members, friends, coworkers, employers, and communities.

Numerous factors can affect the risk of unintentional injury and violence, including individual behaviors, physical environment, access to health services (ranging from pre-hospital and acute care to rehabilitation), and social environment (from parental monitoring and supervision of youth to peer group associations, neighborhoods, and communities).

Interventions addressing these social and physical factors have the potential to prevent unintentional injuries and violence. Efforts to prevent unintentional injury may focus on:

- Modifications of the environment
- Improvements in product safety
- Legislation and enforcement
- Education and behavior change
- Technology and engineering

Efforts to prevent violence may focus on:

- Changing social norms about the acceptability of violence
- Improving problem-solving skills (for example, parenting, conflict resolution, coping)
- Changing policies to address the social and economic conditions that often give rise to violence

Leading Causes of Accidental Death

Motor vehicle accidents, poisoning, falls, and suffocation accounted for 8 in 10 accidental deaths in the Columbus Regional Hospital Service Area between 2011 and 2013.
Leading Causes of Accidental Death
(Columbus Regional Hospital Service Area, 2011-2013)

Motor Vehicle Accidents 33.2%
Poisoning/Noxious Substances 29.9%
Suffocation 6.5%
Falls 10.7%
Other 19.7%

Notes: ● Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).

Unintentional Injury

Age-Adjusted Unintentional Injury Deaths

Between 2011 and 2013, there was an annual average age-adjusted unintentional injury mortality rate of 47.1 deaths per 100,000 population in the service area.

● Less favorable than the Indiana rate.
● Less favorable than the national rate.
● Fails to satisfy the Healthy People 2020 target (36.4 or lower).
● Dramatically higher in Jennings County than in Bartholomew.

Motor Vehicle Safety
Age-Adjusted Motor-Vehicle Related Deaths

Between 2011 and 2013, there was an annual average age-adjusted motor vehicle crash mortality rate of 16.0 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

• Higher than found statewide.
• Higher than found nationally.
• Fails to satisfy the Healthy People 2020 target (12.4 or lower).
• Much higher in Jennings County than in Bartholomew.

Seat Belt Usage - Adults

Most Columbus Regional Hospital Service Area adults (86.5%) report “always” wearing a seat belt when driving or riding in a vehicle.

- Comparable to the percentage found nationally.
- Fails to satisfy the Healthy People 2020 target of 92.0% or higher.
- Favorably high in Bartholomew County.
- TREND: In Bartholomew County, marks a statistically significant increase over time.

Men in the service area are less likely to report consistent seat belt usage.
“Always” Wear a Seat Belt
When Driving or Riding in a Vehicle
(Columbus Regional Hospital Service Area, 2015)
Healthy People 2020 Target = 92.0% or Higher

Seat Belt Usage - Children
A full 92.1% of Columbus Regional Hospital Service Area parents report that their child (age 0 to 17) “always” wears a seat belt (or appropriate car seat for younger children) when riding in a vehicle.

- Almost identical to what is found nationally.
- The Bartholomew County prevalence is similar (92.6%).
- TREND: Statistically unchanged since 2000.
**Bicycle Safety**

One-third of Columbus Regional Hospital Service Area children age 5 to 17 (33.7%) are reported to “always” wear a helmet when riding a bicycle.

- Much lower than the national prevalence.
- The Bartholomew County prevalence is 37.5%.
- TREND: Marks a statistically significant increase over time.

Firearm Safety
Age-Adjusted Firearm-Related Deaths

Between 2011 and 2013, the service area reported an annual average age-adjusted rate of 9.7 deaths per 100,000 population due to firearms.

- Better than found statewide.
- Better than found nationally.
- Similar to the Healthy People 2020 objective (9.3 or lower).
- The Bartholomew County rate was higher (13.0).

Presence of Firearms in Homes
Overall, more than 4 in 10 service area adults (46.9%) have a firearm kept in or around their home.

• Higher than the national prevalence.
• Similar findings by county.
• TREND: Similar to that reported in 1996.
• Among Columbus Regional Hospital Service Area households with children, 47.9% have a firearm kept in or around the house (less favorable than reported nationally).
• TREND: The prevalence of firearms in households with children has not changed significantly over time (not shown).
Have a Firearm Kept in or Around the Home

Bartholomew County

Higher-income households report a greater prevalence of firearms in or around the home.

Among Columbus Regional Hospital Service Area households with firearms, 16.7% report that there is at least one weapon that is kept unlocked and loaded.

Almost identical to that found nationally.

Sources:  
- Federal Bureau of Investigation, FBI Uniform Crime Reports: 2012  

Notes:  
- This indicator reports the rate of violent crime offenses reported by the sheriff’s office or county police department per 100,000 residents. Violent crime includes homicide, rape, robbery, and aggravated assault. This indicator is relevant because it assesses community safety.  
- Participation by law enforcement agencies in the UCR program is voluntary. Sub-state data do not necessarily represent an exhaustive list of crimes due to gaps in reporting. Also, some institutions of higher education have their own police departments, which handle offenses occurring within campus grounds; these offenses are not included in the violent crime statistics, but can be obtained from the Uniform Crime Reports Universities and Colleges data tables.

**Victimization**

A total of 1.6% of Columbus Regional Hospital Service Area adults acknowledge being the victim of a violent crime in the past five years.

- Statistically similar to national findings.
- Highest in Bartholomew County, lowest (0.0%) in Jennings.
- TREND: Statistically unchanged since 2012.
Victim of a Violent Crime in the Past Five Years

Reports of violence are notably higher among women and residents living in the lower income category.

Victim of a Violent Crime in the Past Five Years
(Columbus Regional Hospital Service Area, 2015)
Family Violence

A total of 1.4% of respondents acknowledge that they have been hit, slapped, pushed, kicked, or otherwise hurt by an intimate partner in the past 3 years.

- Unfavorably high in Bartholomew County, lowest (0.0%) in Jackson.
- TREND: Marks a statistically significant decrease over time.

Reports of domestic violence are also notably higher among:

- Women.
- Adults under age 65 (negative correlation with age).
- Those in households with lower incomes.
Have Ever Been Hit, Slapped, Pushed, Kicked, or Hurt in Any Way by an Intimate Partner in the Past 3 Years
(Columbus Regional Hospital Service Area, 2015)

Sexual Violence
Note also that 1.1% of survey respondents report being forced into some type of sexual activity in the past 3 years.
Key Informant Input: Injury & Violence
The largest share of key informants taking part in an online survey characterized Injury & Violence as a “minor problem” in the community.

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Bullying & Family Violence
There is bullying at the schools, step-father and boyfriend abuse of children, domestic violence and violent crime committed while people are under the influence of drugs. – Community/Business Leaders
In my scope of practice, I encounter families that need the support of Child Protective Services related to violence in the home and injuries that are sustained by persons in the home. – Public Health
We hear about violence at home from students at school. We hear about violence in the media. – Public Health

Addictions & Violence
Both are preventable and yet we may not be recognizing the need for safety in our community. As our community grows the threat of violence related to addictions may also be increasing. – Community/Business Leaders
Diabetes

**About Diabetes**

Diabetes mellitus occurs when the body cannot produce or respond appropriately to insulin. Insulin is a hormone that the body needs to absorb and use glucose (sugar) as fuel for the body’s cells. Without a properly functioning insulin signaling system, blood glucose levels become elevated and other metabolic abnormalities occur, leading to the development of serious, disabling complications. Many forms of diabetes exist; the three common types are Type 1, Type 2, and gestational diabetes. Effective therapy can prevent or delay diabetic complications.

Diabetes mellitus:
- Lowers life expectancy by up to 15 years.
- Increases the risk of heart disease by 2 to 4 times.
- Is the leading cause of kidney failure, lower limb amputations, and adult-onset blindness.

The rate of diabetes mellitus continues to increase both in the United States and throughout the world. Due to the steady rise in the number of persons with diabetes mellitus, and possibly earlier onset of type 2 diabetes mellitus, there is growing concern about the possibility that the increase in the number of persons with diabetes mellitus and the complexity of their care might overwhelm existing healthcare systems.

People from minority populations are more frequently affected by type 2 diabetes. Minority groups constitute 25% of all adult patients with diabetes in the US and represent the majority of children and adolescents with type 2 diabetes.

Lifestyle change has been proven effective in preventing or delaying the onset of type 2 diabetes in high-risk individuals.
- Healthy People 2020 ([www.healthypeople.gov](http://www.healthypeople.gov))

**Age-Adjusted Diabetes Deaths**

Between 2011 and 2013, there was an annual average age-adjusted diabetes mortality rate of 19.8 deaths per 100,000 population in the service area.

- Much more favorable than that found statewide.
- More favorable than the national rate.
- Close to the Healthy People 2020 target (20.5 or lower, adjusted to account for diabetes mellitus-coded deaths).
- Unfavorably high in Jackson County.

Challenges
Among those rating this issue as a “major problem,” the biggest challenges for people with diabetes are seen as:

Lack of Education
I believe as the best treatments of diabetes improve it can be difficult to educate those elders with diabetes. – Other Health
Educating parents of juvenile diabetics, we need more local options. – Public Health
Controlling diabetes. Appropriate education. Many calls to 911 for diabetic reactions. – Other Health
Information about how to manage the disease. Access to medicine that is affordable. Overall the increase in the number of people affected. – Community/Business Leaders

Obesity & Behavioral Risk
Obesity is a real problem in the community. – Other Health
Culture of fast foods and pre-prepared food, lack of exercise. – Physicians
Recognition that diet and physical activity play into control of the disease. – Community/Business Leaders
Lack of healthy environment to support healthy choices. – Public Health
Inability to control eating habits, exercise, and weight. – Public Health

High Occurrence
With increasing obesity in our population it is important to be aware of the increasing rates of dx and compliance with medication. From personal experience, I’m aware of family members who have difficulty meeting their co-pay for their insulin. – Community/Business Leaders
There seems to be a growing number of cases of diabetes, especially as it pertains to school aged children. Food insecurity might just be the biggest challenge. Healthy foods cost more and don’t seem to be as readily available as higher fat and sugar foods. – Community/Business Leaders
Working in the schools, it appears and the data would support that we are seeing more students being diagnosed with this disease. So the biggest challenge would be that we are seeing more and more youth diagnosed with diabetes. – Community/Business Leaders

Access to Care
The high cost of diabetic medications. The difficulty with accessing a primary care physician and or an
endocrinologist again due to acceptance or not of insurance or no insurance at all. – Other Health
Access to care for proper management of the disease. – Other Health
Access to insulin, due to the high cost of insulin and ever decreasing insurance coverage for many. Many diabetics are rationing their medications or going without to treat their diabetes. Poor understanding of disease and obesity also contribute to this ranking a major problem. – Other Health

Disease Management
Being able to manage their condition so it doesn’t create additional health issues. – Social Services
Maintenance of healthy blood sugars, exercise, health food choices, financial reserves to pay for food and supplies. – Other Health
Alzheimer’s Disease

About Dementia

Dementia is the loss of cognitive functioning—thinking, remembering, and reasoning—to such an extent that it interferes with a person’s daily life. Dementia is not a disease itself, but rather a set of symptoms. Memory loss is a common symptom of dementia, although memory loss by itself does not mean a person has dementia. Alzheimer’s disease is the most common cause of dementia, accounting for the majority of all diagnosed cases.

Alzheimer’s disease is the 6th leading cause of death among adults age 18 years and older. Estimates vary, but experts suggest that up to 5.1 million Americans age 65 years and older have Alzheimer’s disease. These numbers are predicted to more than double by 2050 unless more effective ways to treat and prevent Alzheimer’s disease are found.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Alzheimer’s Disease Deaths

Between 2011 and 2013, there was an annual average age-adjusted Alzheimer’s disease mortality rate of 35.4 deaths per 100,000 population in the service area.

- Less favorable than the statewide rate.
- Less favorable than the national rate.
- Unfavorably high in Jackson County; lowest in Bartholomew.

Alzheimer’s Disease: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)

![Alzheimer's Disease: Age-Adjusted Mortality Graph]

- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.
- TREND: Alzheimer’s disease mortality has decreased in recent years in the CRH Service Area. Across Indiana and the US, rates are lower, but have increased over time.

---

### Key Informant Input: Dementias, Including Alzheimer’s Disease

Key informants taking part in an online survey are most likely to consider *Dementias, Including Alzheimer's Disease* as a “moderate problem” in the community.

### Perceptions of Dementia/Alzheimer's Disease as a Problem in the Community

*(Key Informants, 2014)*

- **Major Problem:** 15.6%
- **Moderate Problem:** 54.2%
- **Minor Problem:** 22.9%
- **No Problem At All:** 7.3%

**Sources:** PRC Online Key Informant Survey, Professional Research Consultants, Inc.

**Notes:** Asked of all respondents.
Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Longer Lifespans**

As people are living longer, we seem to be seeing more cases of dementia, Alzheimer. I may be more in tune with this as I am seeing many of my friends and co-workers dealing with their parents who have display these conditions. Also my sister works in an assisted living facility where she works with nothing but dementia, Alzheimer’s patients. So again, I might be a bit more sensitive to this topic. – Community/Business Leaders

As our community ages and survives, dementia will continue to increase in occurrences. – Other Health

**High Occurrence**

The incidence of dementia is increasing and is causing significant problems for families in the community. There are limited resources available to plan for and treat the progression of this disease. – Public Health
Kidney Disease

About Chronic Kidney Disease

Chronic kidney disease and end-stage renal disease are significant public health problems in the United States and a major source of suffering and poor quality of life for those afflicted. They are responsible for premature death and exact a high economic price from both the private and public sectors. Nearly 25% of the Medicare budget is used to treat people with chronic kidney disease and end-stage renal disease.

Genetic determinants have a large influence on the development and progression of chronic kidney disease. It is not possible to alter a person’s biology and genetic determinants; however, environmental influences and individual behaviors also have a significant influence on the development and progression of chronic kidney disease. As a result, some populations are disproportionately affected. Successful behavior modification is expected to have a positive influence on the disease.

Diabetes is the most common cause of kidney failure. The results of the Diabetes Prevention Program (DPP) funded by the national Institute of Diabetes and Digestive and Kidney Diseases (NIDDK) show that moderate exercise, a healthier diet, and weight reduction can prevent development of type 2 diabetes in persons at risk.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Kidney Disease Deaths

Between 2011 and 2013 there was an annual average age-adjusted kidney disease mortality rate of 18.8 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Comparable to the rate found statewide.
- Less favorable than the national rate.
- Much higher in Bartholomew County than in Jackson.

**Potentially Disabling Conditions**

**About Arthritis, Osteoporosis & Chronic Back Conditions**

There are more than 100 types of arthritis. Arthritis commonly occurs with other chronic conditions, such as diabetes, heart disease, and obesity. Interventions to treat the pain and reduce the functional limitations from arthritis are important, and may also enable people with these other chronic conditions to be more physically active. Arthritis affects 1 in 5 adults and continues to be the most common cause of disability. It costs more than $128 billion per year. All of the human and economic costs are projected to increase over time as the population ages. There are interventions that can reduce arthritis pain and functional limitations, but they remain underused. These include: increased physical activity; self-management education; and weight loss among overweight/obese adults.

Osteoporosis is a disease marked by reduced bone strength leading to an increased risk of fractures (broken bones). In the United States, an estimated 5.3 million people age 50 years and older have osteoporosis. Most of these people are women, but about 0.8 million are men. Just over 34 million more people, including 12 million men, have low bone mass, which puts them at increased risk for developing osteoporosis. Half of all women and as many as 1 in 4 men age 50 years and older will have an osteoporosis-related fracture in their lifetime.

Chronic back pain is common, costly, and potentially disabling. About 80% of Americans experience low back pain in their lifetime. It is estimated that each year:

- 15%-20% of the population develop protracted back pain.
- 2-8% have chronic back pain (pain that lasts more than 3 months).
- 3-4% of the population is temporarily disabled due to back pain.
- 1% of the working-age population is disabled completely and permanently as a result of low back pain.

Americans spend at least $50 billion each year on low back pain. Low back pain is the:

- 2nd leading cause of lost work time (after the common cold).
- 3rd most common reason to undergo a surgical procedure.
- 5th most frequent cause of hospitalization.

Arthritis, osteoporosis, and chronic back conditions all have major effects on quality of life, the ability to work, and basic activities of daily living.

**Sciatica/Chronic Back Pain**

A total of 23.9% of survey respondents suffer from chronic back pain or sciatica.

- Less favorable than that found nationwide.
- Highest in Jennings County; lowest in Bartholomew.
- TREND: Denotes a statistically significant increase since 1996.
Prevalence of Sciatica/Chronic Back Pain

Key Informant Input: Arthritis, Osteoporosis & Chronic Back Conditions

Most key informants taking part in an online survey characterized Arthritis, Osteoporosis & Chronic Back Conditions as a “moderate problem” in the community.

Perceptions of Arthritis/Osteoporosis/Back Conditions as a Problem in the Community (Key Informants, 2014)

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Aging Population

As our population grows older these conditions prevalence rates increase. Stress factors and lower mobility also increase these conditions. There are limited specialists for arthritis, Rheumatology in our community. – Community/Business Leaders
**Chronic Pain Epidemic**

*Part of the hidden problem of the chronic pain epidemic. – Physicians*

**Quality of Life**

*We receive many calls from people with these conditions and they significantly impair and limit their quality of life. – Social Services*

## Vision & Hearing Impairment

### About Vision

Vision is an essential part of everyday life, influencing how Americans of all ages learn, communicate, work, play, and interact with the world. Yet millions of Americans live with visual impairment, and many more remain at risk for eye disease and preventable eye injury.

The eyes are an important, but often overlooked, part of overall health. Despite the preventable nature of some vision impairments, many people do not receive recommended screenings and exams. A visit to an eye care professional for a comprehensive dilated eye exam can help to detect common vision problems and eye diseases, including diabetic retinopathy, glaucoma, cataract, and age-related macular degeneration.

These common vision problems often have no early warning signs. If a problem is detected, an eye care professional can prescribe corrective eyewear, medicine, or surgery to minimize vision loss and help a person see his or her best.

Healthy vision can help to ensure a healthy and active lifestyle well into a person's later years. Educating and engaging families, communities, and the nation is critical to ensuring that people have the information, resources, and tools needed for good eye health.

- Healthy People 2020 ([www.healthypeople.gov](http://www.healthypeople.gov))

### Hearing Trouble

#### About Hearing & Other Sensory or Communication Disorders

An impaired ability to communicate with others or maintain good balance can lead many people to feel socially isolated, have unmet health needs, have limited success in school or on the job. Communication and other sensory processes contribute to our overall health and well-being. Protecting these processes is critical, particularly for people whose age, race, ethnicity, gender, occupation, genetic background, or health status places them at increased risk.

Many factors influence the numbers of Americans who are diagnosed and treated for hearing and other sensory or communication disorders, such as social determinants (social and economic standings, age of diagnosis, cost and stigma of wearing a hearing aid, and unhealthy lifestyle choices). In addition, biological causes of hearing loss and other sensory or communication disorders include: genetics; viral or bacterial infections; sensitivity to certain drugs or medications; injury; and aging.

As the nation’s population ages and survival rates for medically fragile infants and for people with severe injuries and acquired diseases improve, the prevalence of sensory and communication disorders is expected to rise.

- Healthy People 2020 ([www.healthypeople.gov](http://www.healthypeople.gov))
**Key Informant Input: Vision & Hearing**

A majority of key informants taking part in an online survey characterized Vision & Hearing as a “minor problem” in the community.

**Top Concerns**

Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Cost of Care**

- **Cost of access to care.** Medicare does not cover cost of these services. – Social Services

**Aging Population**

- **Increase in the average age of members of the community.** Lack of affordable insurance coverage for vision and hearing aids. Cost for these services prohibits people from seeking help. – Community/Business Leaders
Infectious Disease
Influenza & Pneumonia Vaccination

About Influenza & Pneumonia

Acute respiratory infections, including pneumonia and influenza, are the 8th leading cause of death in the nation, accounting for 56,000 deaths annually. Pneumonia mortality in children fell by 97% in the last century, but respiratory infectious diseases continue to be leading causes of pediatric hospitalization and outpatient visits in the US. On average, influenza leads to more than 200,000 hospitalizations and 36,000 deaths each year. The 2009 H1N1 influenza pandemic caused an estimated 270,000 hospitalizations and 12,270 deaths (1,270 of which were of people younger than age 18) between April 2009 and March 2010.

- Healthy People 2020 (www.healthypeople.gov)

Flu Vaccinations

Among Columbus Regional Hospital Service Area seniors, 67.5% received a flu shot (or FluMist®) within the past year.

- More favorable than the Indiana finding.
- More favorable than the national finding.
- Similar to the Healthy People 2020 target (70% or higher).
- The Bartholomew County prevalence is 68.4%.
- TREND: Statistically unchanged since 1996.

Older Adults: Have Had a Flu Vaccination in the Past Year
(Among Adults Age 65+)

Healthy People 2020 Target = 70.0% or Higher

Notes:
- Reflects high-risk respondents age 18-64.
- “High-Risk” includes adults who report having been diagnosed with heart disease, diabetes or respiratory disease.
- Includes FluMist as a form of vaccination.

“High-risk” includes adults who report having been diagnosed with heart disease, diabetes or respiratory disease.
HIV

About HIV

The HIV epidemic in the United States continues to be a major public health crisis. An estimated 1.1 million Americans are living with HIV, and 1 in 5 people with HIV do not know they have it. HIV continues to spread, leading to about 56,000 new HIV infections each year.

HIV is a preventable disease, and effective HIV prevention interventions have been proven to reduce HIV transmission. People who get tested for HIV and learn that they are infected can make significant behavior changes to improve their health and reduce the risk of transmitting HIV to their sex or drug-using partners. More than 50% of new HIV infections occur as a result of the 21% of people who have HIV but do not know it.

In the era of increasingly effective treatments for HIV, people with HIV are living longer, healthier, and more productive lives. Deaths from HIV infection have greatly declined in the United States since the 1990s. As the number of people living with HIV grows, it will be more important than ever to increase national HIV prevention and healthcare programs.

There are gender, race, and ethnicity disparities in new HIV infections:

- Nearly 75% of new HIV infections occur in men.
- More than half occur in gay and bisexual men, regardless of race or ethnicity.
- 45% of new HIV infections occur in African Americans, 35% in whites, and 17% in Hispanics.

Improving access to quality healthcare for populations disproportionately affected by HIV, such as persons of color and gay and bisexual men, is a fundamental public health strategy for HIV prevention.

People getting care for HIV can receive:

- Antiretroviral therapy
- Screening and treatment for other diseases (such as sexually transmitted infections)
- HIV prevention interventions
- Mental health services
- Other health services

As the number of people living with HIV increases and more people become aware of their HIV status, prevention strategies that are targeted specifically for HIV-infected people are becoming more important.

Prevention work with people living with HIV focuses on:

- Linking to and staying in treatment.
- Increasing the availability of ongoing HIV prevention interventions.
- Providing prevention services for their partners.

Public perception in the US about the seriousness of the HIV epidemic has declined in recent years. There is evidence that risky behaviors may be increasing among uninfected people, especially gay and bisexual men. Ongoing media and social campaigns for the general public and HIV prevention interventions for uninfected persons who engage in risky behaviors are critical.

- Healthy People 2020 (www.healthypeople.gov)
HIV Prevalence
In 2010, there was a prevalence of 72.4 HIV cases per 100,000 population in the Columbus Regional Hospital Service Area.

- More favorable than the statewide prevalence.
- Much more favorable than the national prevalence.
- Favorably low in Jennings County.

Key Informant Input: HIV/AIDS
Most key informants taking part in an online survey characterized Sexually Transmitted Diseases as a “minor problem” in the community.
Sexually Transmitted Diseases

About Sexually Transmitted Diseases

STDs refer to more than 25 infectious organisms that are transmitted primarily through sexual activity. Despite their burdens, costs, and complications, and the fact that they are largely preventable, STDs remain a significant public health problem in the United States. This problem is largely unrecognized by the public, policymakers, and health care professionals. STDs cause many harmful, often irreversible, and costly clinical complications, such as: reproductive health problems; fetal and perinatal health problems; cancer; and facilitation of the sexual transmission of HIV infection.

Because many cases of STDs go undiagnosed—and some common viral infections, such as human papillomavirus (HPV) and genital herpes, are not reported to CDC at all—the reported cases of chlamydia, gonorrhea, and syphilis represent only a fraction of the true burden of STDs in the US. Untreated STDs can lead to serious long-term health consequences, especially for adolescent girls and young women. Several factors contribute to the spread of STDs.

Biological Factors. STDs are acquired during unprotected sex with an infected partner. Biological factors that affect the spread of STDs include:

- **Asymptomatic nature of STDs.** The majority of STDs either do not produce any symptoms or signs, or they produce symptoms so mild that they are unnoticed; consequently, many infected persons do not know that they need medical care.
- **Gender disparities.** Women suffer more frequent and more serious STD complications than men do. Among the most serious STD complications are pelvic inflammatory disease, ectopic pregnancy (pregnancy outside of the uterus), infertility, and chronic pelvic pain.
- **Age disparities.** Compared to older adults, sexually active adolescents ages 15 to 19 and young adults ages 20 to 24 are at higher risk for getting STDs.
- **Lag time between infection and complications.** Often, a long interval, sometimes years, occurs between acquiring an STD and recognizing a clinically significant health problem.

Social, Economic and Behavioral Factors. The spread of STDs is directly affected by social, economic, and behavioral factors. Such factors may cause serious obstacles to STD prevention due to their influence on social and sexual networks, access to and provision of care, willingness to seek care, and social norms regarding sex and sexuality. Among certain vulnerable populations, historical experience with segregation and discrimination exacerbates these factors. Social, economic, and behavioral factors that affect the spread of STDs include: racial and ethnic disparities; poverty and marginalization; access to healthcare; substance abuse; sexuality and secrecy (stigma and discomfort discussing sex); and sexual networks (persons “linked” by sequential or concurrent sexual partners).

- Healthy People 2020 (www.healthypeople.gov)

Chlamydia & Gonorrhea

In 2011, the chlamydia incidence rate in the Columbus Regional Hospital Service Area was 294.6 cases per 100,000 population.

- Notably lower than the Indiana incidence rate.
- Notably lower than the national incidence rate.
- Highest in Jennings County, lowest in Bartholomew.

The service area reported a 2011 gonorrhea incidence rate of 27.5 cases per 100,000 population in 2011.

- Notably lower than the Indiana incidence rate.
Notably lower than the national incidence rate.

Highest in Bartholomew County.

Chlamydia & Gonorrhea Incidence
(Incidence Rate per 100,000 Population, 2011)

Key Informant Input: Sexually Transmitted Diseases
Most key informants taking part in an online survey characterized Sexually Transmitted Diseases as a “minor problem” in the community.

Perceptions of Sexually Transmitted Diseases as a Problem in the Community
(Key Informants, 2014)

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

Upward Trend
Rise in AIDS in neighboring counties, possibly due to drug use versus sex. – Other Health
Key Informant Input: Immunization & Infectious Diseases

A majority of key informants taking part in an online survey characterized Immunization & Infectious Diseases as a “minor problem” in the community.

Perceptions of Immunization and Infectious Diseases as a Problem in the Community
(Key Informants, 2014)

Notes: Asked of all respondents.

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Childhood Vaccinations

*We are seeing more parents who are not vaccinating their children out of choice and although it has not become a severe problem in our area. National trends could catch up here locally at some point.* – Community/Business Leaders
Births
Birth Outcomes & Risks

Low-Weight Births

A total of 7.8% of 2006-2012 Columbus Regional Hospital Service Area births were low-weight.

- Better than the Indiana proportion.
- Better than the national proportion.
- Similar to the Healthy People 2020 target (7.8% or lower).
- Lowest in Jennings County.

Low-Weight Births
(Percent of Live Births, 2006-2012)
Healthy People 2020 Target = 7.8% or Lower

Sources:

Note:
- This indicator reports the percentage of total births that are low birth weight (Under 2500g). This indicator is relevant because low birth weight infants are at high risk for health problems. This indicator can also highlight the existence of health disparities.

Infant Mortality

Between 2011 and 2013, there was an annual average of 8.9 infant deaths per 1,000 live births in the CRH Service Area.

- Worse than the Indiana rate.
- Worse than the national rate.
- Fails to satisfy the Healthy People 2020 target of 6.0 per 1,000 live births.
- The Bartholomew County mortality rate was 10.5.
Infant Mortality Rate
(Annual Average Infant Deaths per 1,000 Live Births, 2011-2013)
Healthy People 2020 Target = 6.0 or Lower

TREND: The infant mortality rate has increased over baseline data (mid-2000s), although no obvious trend is apparent.

Notes:
- Infants deaths include deaths of children under 1 year old.
- This indicator is relevant because high rates of infant mortality indicate the existence of broader issues pertaining to access to care and maternal and child health.

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted June 2015.
Key Informant Input: Infant & Child Health

Key informants taking part in an online survey generally characterized Infant & Child Health as a “moderate problem” in the community.

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Cost/Lack of Coverage
- Number of households that do not have insurance that can cover their dependents. – Community/Business Leaders
- Lower income families need resources for infant and child health that are free to them and accessible to them. – Public Health

Teen Parents
- Increase in number of teen parents. – Community/Business Leaders
- The teen parents don’t know where to take their child for affordable care. If the person has insurance the child seems to be taken care of. – Public Health

Prenatal Care
- Many women do not receive early prenatal care. Adult smoking rates are high. Too few mothers breastfeed. High percentage of teen mothers. – Physicians

Lack of Prevention
- Much focus on sick care and not on well care. – Public Health
Breastfeeding

Prevalence of Breastfeeding

Just over one-half (53.0%) of service area parents with children under 6 report that their child was breastfed or fed breast milk during infancy.

- TREND: In Bartholomew County, statistically unchanged from the 2009 survey findings.

Among parents with breastfed children, the largest share (37.0%) report that their child was breastfed or fed breast milk for one to three months. Note that 16.9% of parents with breastfed children report that the child was breastfed or fed breast milk for one year or longer.

- The median response for age of child when breastfeeding ended was 6 months (up from 5 months reported in 2012).

Notes: Asked of respondents with a child aged 0 to 5 years old.

Asked why the child was eventually weaned, responses from parents of breastfed children included “mother’s choice,” “low milk supply,” and “self-weaned,” to name a few.

Among service area parents of children under 6, 79.6% report feeding their child something other than breastmilk at some point before the age of four months, with the median age being one month.

- In 2012, the median age was two months.
**Age at Which Child Was Fed Something Other Than Breastmilk**
(Among CRH Service Area Parents of Breastfed Children; 2015)

- **Six or More Months**: 17.3%
- **Five Months**: 1.4%
- **Four Months**: 1.7%
- **Three Months**: 2.2%
- **Two Months**: 6.5%
- **One Month**: 32.7%
- **Less Than One Month**: 38.2%

Median Age = 1 Month
2012 = 2 Months

Sources: ● 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 357]
Notes: ● Asked of all respondents whose child was breastfed.

**Breastfeeding Support**
While 27.0% of parents with breastfed children reportedly had no one for breastfeeding support, 18.9% mentioned **CRH Lactation Consultants**, 14.0% mentioned **friends or family**, 6.5% mentioned a **doctor’s office**, and 4.9% relied on **La Leche League** for support. **WIC** was also mentioned by 4.8%.

**Source for Breastfeeding Support**
(Among CRH Service Area Parents of Breastfed Children; 2015)

- **Friend/Family**: 14.0%
- **CRH Lactation Consultants**: 18.9%
- **Did Not Need**: 5.6%
- **La Leche League**: 4.9%
- **WIC**: 4.8%
- **Other**: 1.3%
- **Uncertain**: 17.1%
- **No One**: 27.0%

Sources: ● 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 355]
Notes: ● Asked of all respondents whose child was breastfed.

In a follow-up inquiry, 3.8% of these respondents reported that there was a time when someone in the household needed breastfeeding support but didn’t know who to contact.
Family Planning

Births to Teen Mothers

About Teen Births
The negative outcomes associated with unintended pregnancies are compounded for adolescents. Teen mothers:

- Are less likely to graduate from high school or attain a GED by the time they reach age 30.
- Earn an average of approximately $3,500 less per year, when compared with those who delay childbearing.
- Receive nearly twice as much Federal aid for nearly twice as long.

Similarly, early fatherhood is associated with lower educational attainment and lower income. Children of teen parents are more likely to have lower cognitive attainment and exhibit more behavior problems. Sons of teen mothers are more likely to be incarcerated, and daughters are more likely to become adolescent mothers.

Healthy People 2020 (www.healthypeople.gov)

Between 2006 and 2012, there was an annual average of 54.2 births to women age 15-19 per 1,000 population in that age group.

- Higher than the Indiana proportion.
- Higher than the national proportion.
- Unfavorably high in Jackson County.

Teen Birth Rate
(Births to Women Age 15-19 Per 1,000 Female Population Age 15-19, 2006-2012)

Sources:
- Retrieved June 2015 from Community Commons at http://www.chna.org

Notes:
- This indicator reports the rate of total births to women under the age of 15 -19 per 1,000 female population age 15 -19. This indicator is relevant because in many cases, teen parents have unique social, economic, and health support services. Additionally, high rates of teen pregnancy may indicate the prevalence of unsafe sex practices.
Key Informant Input: Family Planning

Key informants taking part in an online survey largely characterized Family Planning as a “minor problem” in the community (with “moderate problem” receiving a nearly identical proportion of responses).

Perceptions of Family Planning as a Problem in the Community

Notes: Asked of all respondents.

Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Teen Pregnancy

Too many teenage pregnancies. Too many students attending school without the proper preparation from home. Too many children getting a slow start to life. – Community/Business Leaders

The rate of teen pregnancy. They don’t seem to know where to get care, how the care is provided and when they need it. – Public Health

Young adults having children who are not financially stable to do so. – Public Health

See many young women who are having children without resources, which continue in the cycle of dependence on the system rather than independence. Poor health habits which are passed on the children. – Other Health

Education & Information

Access to information about family planning that is unbiased or nonjudgmental is lacking. Availability for affordable birth control is limited. Number of teenage parents is increasing. – Community/Business Leaders

Our community does not discuss it. It is perceived to be too politically charged. Thus, there is a lack of information for those who need it. – Social Services
Modifiable Health Risks
Actual Causes Of Death

**About Contributors to Mortality**

A 1999 study (an update to a landmark 1993 study), estimated that as many as 40% of premature deaths in the United States are attributed to behavioral factors. This study found that behavior patterns represent the single-most prominent domain of influence over health prospects in the United States. The daily choices we make with respect to diet, physical activity, and sex; the substance abuse and addictions to which we fall prey; our approach to safety; and our coping strategies in confronting stress are all important determinants of health.

The most prominent contributors to mortality in the United States in 2000 were tobacco (an estimated 435,000 deaths), diet and activity patterns (400,000), alcohol (85,000), microbial agents (75,000), toxic agents (55,000), motor vehicles (43,000), firearms (29,000), sexual behavior (20,000), and illicit use of drugs (17,000). Socioeconomic status and access to medical care are also important contributors, but difficult to quantify independent of the other factors cited. Because the studies reviewed used different approaches to derive estimates, the stated numbers should be viewed as first approximations.

These analyses show that smoking remains the leading cause of mortality. However, poor diet and physical inactivity may soon overtake tobacco as the leading cause of death. These findings, along with escalating healthcare costs and aging population, argue persuasively that the need to establish a more preventive orientation in the US healthcare and public health systems has become more urgent.

**Factors Contributing to Premature Deaths in the United States**

While causes of death are typically described as the diseases or injuries immediately precipitating the end of life, a few important studies have shown that the actual causes of premature death (reflecting underlying risk factors) are often preventable.

**Nutrition**

**About Healthful Diet & Healthy Weight**

Strong science exists supporting the health benefits of eating a healthful diet and maintaining a healthy body weight. Efforts to change diet and weight should address individual behaviors, as well as the policies and environments that support these behaviors in settings such as schools, worksites, healthcare organizations, and communities.

The goal of promoting healthful diets and healthy weight encompasses increasing household food security and eliminating hunger.

Americans with a healthful diet:

- Consume a variety of nutrient-dense foods within and across the food groups, especially whole grains, fruits, vegetables, low-fat or fat-free milk or milk products, and lean meats and other protein sources.
- Limit the intake of saturated and trans fats, cholesterol, added sugars, sodium (salt), and alcohol.
- Limit caloric intake to meet caloric needs.

Diet and body weight are related to health status. Good nutrition is important to the growth and development of children. A healthful diet also helps Americans reduce their risks for many health conditions, including: overweight and obesity; malnutrition; iron-deficiency anemia; heart disease; high blood pressure; dyslipidemia (poor lipid profiles); type 2 diabetes; osteoporosis; oral disease; constipation; diverticular disease; and some cancers.

Diet reflects the variety of foods and beverages consumed over time and in settings such as worksites, schools, restaurants, and the home. Interventions to support a healthier diet can help ensure that:

- Individuals have the knowledge and skills to make healthier choices.
- Healthier options are available and affordable.

**Social Determinants of Diet.** Demographic characteristics of those with a more healthful diet vary with the nutrient or food studied. However, most Americans need to improve some aspect of their diet.

Social factors thought to influence diet include:

- Knowledge and attitudes
- Skills
- Social support
- Societal and cultural norms
- Food and agricultural policies
- Food assistance programs
- Economic price systems

**Physical Determinants of Diet.** Access to and availability of healthier foods can help people follow healthful diets. For example, better access to retail venues that sell healthier options may have a positive impact on a person’s diet; these venues may be less available in low-income or rural neighborhoods.

The places where people eat appear to influence their diet. For example, foods eaten away from home often have more calories and are of lower nutritional quality than foods prepared at home.

Marketing also influences people’s—particularly children’s—food choices.

- Healthy People 2020 (www.healthypeople.gov)
Fruit & Vegetable Consumption

While 11.7% of survey respondents did not have any fruits or vegetables during the day preceding the interview and 20.2% report eating just one fruit or vegetable on that day, a total of 11.3% report eating 5+ fruits/vegetables the day before the interview.

**Low Food Access (Food Deserts)**

US Department of Agriculture data show that 27.5% of the CRH Service Area population (representing over 40,000 residents) have low food access or live in a “food desert,” meaning that they do not live near a supermarket or large grocery store.

• Less favorable than statewide findings.
• Less favorable than national findings.
• Favorably low in Jennings County.
Population With Low Food Access

<td>23.6%</td>
</tr>
</tbody>
</table>

Notable: 40,661 individuals have low food access.

Notes:
- This indicator reports the percentage of the population living in census tracts designated as food deserts. A food desert is defined as low-income areas where a significant number or share of residents is far from a supermarket, where “far” is more than 1 mile in urban areas and more than 10 miles in rural areas. This indicator is relevant because it highlights populations and geographies facing food insecurity.

- The following map provides an illustration of food deserts by census tract. Note the pockets of darker color where large shares of residents have limited food access.
Family Meals

While 3 in 10 survey respondents (30.0%) do not share any family meals without the TV on during a routine week, another 3 in 10 (30.8%) do so at least daily.

- The median number of weekly family meals among survey respondents was 3 meals per week (unchanged from the 2012 survey findings).

Number of Meals per Week Eaten Together as a Family
(CRH Service Area, 2015)

![Pie chart showing distribution of meals per week eaten together as a family.]

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 328]
Notes: Asked of all respondents.

- The proportion of CRH Service Area residents who eat 5+ meals together as a family without television each week is highest in Bartholomew County, lowest in Jackson.
- TREND: Has not changed significantly from 2009 survey results.

Eat 5+ Meals per Week Together as a Family

![Bar graph showing percentage of respondents eating 5+ meals per week.]

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 364]
Notes: Asked of all respondents. Does not include meals during which the television is on.
Those less likely to report that their family shares 5+ meals per week without the television set on include:

- Residents age 40 to 64.
- Lower-income residents.

**Eat 5+ Meals per Week Together as a Family**  
(Columbus Regional Hospital Service Area, 2015)

Notes:
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., "White" reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. "Low Income" includes households with incomes up to 200% of the federal poverty level; "Mid/High Income" includes households with incomes at 200% or more of the federal poverty level.
- Does not include meals during which the television is on.
Physical Activity

About Physical Activity

Regular physical activity can improve the health and quality of life of Americans of all ages, regardless of the presence of a chronic disease or disability. Among adults and older adults, physical activity can lower the risk of: early death; coronary heart disease; stroke; high blood pressure; type 2 diabetes; breast and colon cancer; falls; and depression. Among children and adolescents, physical activity can: improve bone health; improve cardiorespiratory and muscular fitness; decrease levels of body fat; and reduce symptoms of depression. For people who are inactive, even small increases in physical activity are associated with health benefits.

Personal, social, economic, and environmental factors all play a role in physical activity levels among youth, adults, and older adults. Understanding the barriers to and facilitators of physical activity is important to ensure the effectiveness of interventions and other actions to improve levels of physical activity.

Factors positively associated with adult physical activity include: postsecondary education; higher income; enjoyment of exercise; expectation of benefits; belief in ability to exercise (self-efficacy); history of activity in adulthood; social support from peers, family, or spouse; access to and satisfaction with facilities; enjoyable scenery; and safe neighborhoods.

Factors negatively associated with adult physical activity include: advancing age; low income; lack of time; low motivation; rural residency; perception of great effort needed for exercise; overweight or obesity; perception of poor health; and being disabled. Older adults may have additional factors that keep them from being physically active, including lack of social support, lack of transportation to facilities, fear of injury, and cost of programs.

Among children ages 4 to 12, the following factors have a positive association with physical activity: gender (boys); belief in ability to be active (self-efficacy); and parental support.

Among adolescents ages 13 to 18, the following factors have a positive association with physical activity: parental education; gender (boys); personal goals; physical education/school sports; belief in ability to be active (self-efficacy); and support of friends and family.

Environmental influences positively associated with physical activity among children and adolescents include:

- Presence of sidewalks
- Having a destination/walking to a particular place
- Access to public transportation
- Low traffic density
- Access to neighborhood or school play area and/or recreational equipment

People with disabilities may be less likely to participate in physical activity due to physical, emotional, and psychological barriers. Barriers may include the inaccessibility of facilities and the lack of staff trained in working with people with disabilities.

- Healthy People 2020 (www.healthypeople.gov)
Leisure-Time Physical Activity

A total of 22.4% of Columbus Regional Hospital Service Area adults report no leisure-time physical activity in the past month.

- More favorable than statewide findings.
- Similar to national findings.
- Satisfies the Healthy People 2020 target (32.6% or lower).
- Unfavorably high in Jennings County.
- TREND: Marks a statistically significant improvement since 1996.

No Leisure-Time Physical Activity in the Past Month

- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

Activity Levels

Recommended Levels of Physical Activity

Adults (age 18–64) should do 2 hours and 30 minutes a week of moderate-intensity, or 1 hour and 15 minutes (75 minutes) a week of vigorous-intensity aerobic physical activity, or an equivalent combination of moderate- and vigorous-intensity aerobic physical activity. Aerobic activity should be performed in episodes of at least 10 minutes, preferably spread throughout the week.

Additional health benefits are provided by increasing to 5 hours (300 minutes) a week of moderate-intensity aerobic physical activity, or 2 hours and 30 minutes a week of vigorous-intensity physical activity, or an equivalent combination of both.

Older adults (age 65 and older) should follow the adult guidelines. If this is not possible due to limiting chronic conditions, older adults should be as physically active as their abilities allow. They should avoid inactivity. Older adults should do exercises that maintain or improve balance if they are at risk of falling.

For all individuals, some activity is better than none. Physical activity is safe for almost everyone, and the health benefits of physical activity far outweigh the risks.

Recommended Levels of Physical Activity

A total of 47.2% of Columbus Regional Hospital Service Area adults participate in regular, sustained moderate or vigorous physical activity (meeting physical activity recommendations).

- Comparable to national findings.
- Unfavorably low in Jennings County.
- TREND: Statistically unchanged from 2009 survey findings.

Distance of Daily Commute

Among employed CRH Service Area residents who work outside the home, half (49.9%) work within 5 miles of home.

- In contrast, 14.9% of these residents commute 21 miles or more each way for work.
- The median response to the inquiry was 5 miles (unchanged over time).

### Number of Miles Between Home and Work

(Among CRH Service Area Respondents Who Work Outside the Home, 2015)

- Less Than 1 Mile: 16.4%
- 1 to 5 Miles: 33.5%
- 5 to 10 Miles: 16.2%
- 10 to 15 Miles: 10.4%
- 15 to 20 Miles: 8.6%
- 20 or More Miles: 14.9%

Median Response = 5 Miles

Sources:  
2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 331]  
Notes:  
- Asked of those respondents who work outside the home.

Access to Physical Activity

Community Features & Barriers

When asked about community features which help them to be more active, the largest share of respondents (22.9%) mentioned new trails, while 22.3% of respondents do not think any local features help them to be more active, and 15.4% feel that improved sidewalks help.

- Other features mentioned included bike lanes/routes, personal choice, and driver awareness.
With regard to barriers in the community which prevent respondents from being more active, 24.4% of survey respondents cited their own health issues as their primary barriers, while 16.9% mentioned limited or poor-quality sidewalks.

- Another 14.5% of respondents do not feel there are any community barriers to being more physically active, while 11.7% do not feel they have enough time to exercise, and 8.4% do not think there are enough local destinations for physical activity.
- Other barriers included age and a lack of motivation.

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 338]
Notes: Asked of all respondents.
Discussing those community features which, if improved, would increase physical activity among residents, survey respondents were likely to mention sidewalks, trails, safer bike infrastructure, closer destinations, and trees/streetscapes.

**Community Feature That Would Increase Activity if Improved**
*(Columbus Regional Hospital Service Area, 2015)*

- Better/More Sidewalks: 23.7%
- More Trails: 17.7%
- Safer Bike Infrastructure: 12.1%
- Closer Destinations: 11.4%
- Trees/Streetscapes: 6.8%
- Other (each <3%): 3.7%
- Uncertain: 8.7%
- None/Nothing: 15.9%

**Sources:**
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 340]

**Notes:**
- Asked of all respondents.

**Access to Recreation & Fitness Facilities**

In 2011, there were 9.5 recreation/fitness facilities for every 100,000 population in the Columbus Regional Hospital Service Area.

- Similar to what is found statewide.
- Similar to what is found nationally.
- The rate is unfavorably low in Jennings County.

---

Here, recreation/fitness facilities include establishments engaged in operating facilities which offer "exercise and other active physical fitness conditioning or recreational sports activities."

Examples include athletic clubs, gymnasiums, dance centers, tennis clubs, and swimming pools.
Population With Recreation & Fitness Facility Access
(Number of Recreation & Fitness Facilities per 100,000 Population, 2011)

Children’s Physical Activity
Among Columbus Regional Hospital Service Area children age 2 to 17, 61.1% are reported to have had 60 minutes of physical activity on each of the seven days preceding the interview (1+ hours per day).

- More favorable than found nationally.
- The Bartholomew County prevalence is 59.2%.
- Comparable findings by gender.

Child Is Physically Active for One or More Hours per Day
(Among Children Age 2-17)
Screen Time

Among CRH Service Area children aged 5 to 17, 27.6% spend three or more hours on screen time (whether television or computer, Internet, video games, etc.) per day.

- In Bartholomew County, the prevalence is 24.1%.
- Similar findings by gender; significantly higher among teens than younger children.

Children With Three or More Hours per School Day of Total Screen Time [TV, Computer, Video Games, Etc. for Entertainment]
(Among Parents of Children Age 5-17)

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 358]
Notes: Asked of all respondents with children 5-17 at home.
- For this issue, respondents with children who are not in school were asked about “weekdays,” while parents of children in school were asked about typical “school days.”
- “Three or more hours” includes reported screen time of 180 minutes or more per day.
**Choices for Healthy Living**

**Ease in Making Healthier Choices**

Survey respondents were next given a series of lifestyle choices and asked whether these choices are easier, harder, or the same to implement than they were two years ago.

As shown, the largest share of responses for choices being more difficult was for being physically active, followed by walking or biking instead of driving.

- The majority of adults gave “easier” or “same” responses for each of the choices listed, especially helping kids make healthy choices and making healthy choices in a workplace vending environment.

- Asked of all respondents.
- Percentages represent combined “agree” and “strongly agree” responses.
Weight Status

About Overweight & Obesity

Because weight is influenced by energy (calories) consumed and expended, interventions to improve weight can support changes in diet or physical activity. They can help change individuals’ knowledge and skills, reduce exposure to foods low in nutritional value and high in calories, or increase opportunities for physical activity. Interventions can help prevent unhealthy weight gain or facilitate weight loss among obese people. They can be delivered in multiple settings, including healthcare settings, worksites, or schools.

The social and physical factors affecting diet and physical activity (see Physical Activity topic area) may also have an impact on weight. Obesity is a problem throughout the population. However, among adults, the prevalence is highest for middle-aged people and for non-Hispanic black and Mexican American women. Among children and adolescents, the prevalence of obesity is highest among older and Mexican American children and non-Hispanic black girls. The association of income with obesity varies by age, gender, and race/ethnicity.

• Healthy People 2020 (www.healthypeople.gov)

Body Mass Index (BMI), which describes relative weight for height, is significantly correlated with total body fat content. The BMI should be used to assess overweight and obesity and to monitor changes in body weight. In addition, measurements of body weight alone can be used to determine efficacy of weight loss therapy. BMI is calculated as weight (kg)/height squared (m²). To estimate BMI using pounds and inches, use: \[\text{[weight (pounds)/height squared (inches²)] \times 703.}\]

In this report, overweight is defined as a BMI of 25.0 to 29.9 kg/m² and obesity as a BMI ≥30 kg/m². The rationale behind these definitions is based on epidemiological data that show increases in mortality with BMIs above 25 kg/m². The increase in mortality, however, tends to be modest until a BMI of 30 kg/m² is reached. For persons with a BMI ≥30 kg/m², mortality rates from all causes, and especially from cardiovascular disease, are generally increased by 50 to 100 percent above that of persons with BMIs in the range of 20 to 25 kg/m².

**Adult Weight Status**

**Healthy Weight**

Based on self-reported heights and weights, 24.1% of Columbus Regional Hospital Service Area adults are at a healthy weight.

- Worse than the Indiana proportion.
- Worse than the national proportion.
- Fails to satisfy the Healthy People 2020 target (33.9% or higher).
- Most favorable in Bartholomew County; least favorable in Jackson.
- TREND: Denotes a statistically significant decrease in healthy weight since 1996.

**Healthy Weight**

(Percent of Adults With a Body Mass Index Between 18.5 and 24.9)

**Healthy People 2020 Target = 33.9% or Higher**

![Graph showing Healthy Weight percentages for different locations and years]

- 2013 PRC National Health Survey, Professional Research Consultants, Inc.
- Behavioral Risk Factor Surveillance System Data. Atlanta, Georgia. United States Department of Health and Human Services, Centers for Disease Control and Prevention (CDC); 2013 Indiana data.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of healthy weight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), between 18.5 and 24.9.

**Overweight Status**

A total of 74.1% of Columbus Regional Hospital Service Area adults are overweight.

- Higher than the Indiana prevalence.
- Higher than the US overweight prevalence.
- Least favorable in Jackson County.
- TREND: Marks a statistically significant increase in overweight since 1996.
Prevalence of Total Overweight
(Percent of Adults With a Body Mass Index of 25.0 or Higher)

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 151]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of overweight is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 25.0, regardless of gender. The definition for obesity is having a BMI greater than or equal to 30.0.

Further, 35.6% of Columbus Regional Hospital Service Area adults are obese.

- Comparable to Indiana findings.
- Less favorable than US findings.
- Fails to satisfy the Healthy People 2020 target (30.5% or lower).
- Least favorable in Jennings County.
- TREND: Denotes a statistically significant increase in obesity since 1996.

Prevalence of Obesity
(Percent of Adults With a Body Mass Index of 30.0 or Higher)

Healthy People 2020 Target = 30.5% or Lower

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 151]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Based on reported heights and weights, asked of all respondents.
- The definition of obesity is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 30.0, regardless of gender.
Obesity is notably more prevalent among:

- Those between the ages of 40 and 64.
- Adults in households with lower incomes.

**Notes:**
- Based on reported heights and weights, asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
- The definition of obesity is having a body mass index (BMI), a ratio of weight to height (kilograms divided by meters squared), greater than or equal to 30.0, regardless of gender.

**Relationship of Overweight With Other Health Issues**

Overweight and obese adults are more likely to report a number of adverse health conditions. Among these are:

- Hypertension (high blood pressure).
- High cholesterol.
- “Fair” or “poor” physical health.
- 3+ days of poor physical health.
- Activity limitations.
- Diabetes.
- Chronic heart disease.

</tbody>
</table>

Top Concerns
Among those rating this issue as a “major problem,” reasons frequently related to the following:

**Nutrition & Lifestyle Changes**

- Fast food and the amount or volume of sugar filled soft drinks that are consumed. – Community/Business Leaders
- On-going access to and prevalence of junk foods, not all communities have safe places to walk and bike. – Public Health
- This one is tough. I believe our community has made great strides in this area, but citizens are reluctant to change their lifestyles to take advantage of the opportunities. – Community/Business Leaders
This is largely a cultural problem. We are a community of fast foods and convenience foods. The built environment does not encourage walking for biking. – Physicians

Affordable Healthy Options

In my scope of practice, there are families who are struggling to work and provide for their families. They tend to eat fast food or filler food that is loaded with fat and carbs. Depression plays a part in their inactivity which passes down a sedentary pattern to their children. – Public Health

Indiana culture, farming culture, financial resources to buy healthy food choices. – Other Health

Awareness & Education

I see nutrition or more specific the lack of education around good nutrition from newborn to adult, age 18 or so. It needs to start at preconception with the parent and be supported throughout the growing years. – Other Health

Lack of ability, desire to control eating and exercise. – Public Health

Some areas are making great strides in this area. In our lower income population however there is a need for improved physical health. Many programs are not reaching this population, which effects other areas of major concern: diabetes, family planning, mental health. Efforts continue to need to be made to engage those with limited resources become more active and have better health habits. – Other Health

Prevalence

Obesity is a very big issue in our community. – Other Health
Substance Abuse

About Substance Abuse

Substance abuse has a major impact on individuals, families, and communities. The effects of substance abuse are cumulative, significantly contributing to costly social, physical, mental, and public health problems. These problems include:

- Teenage pregnancy
- Human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS)
- Other sexually transmitted diseases (STDs)
- Domestic violence
- Child abuse
- Motor vehicle crashes
- Physical fights
- Crime
- Homicide
- Suicide

Substance abuse refers to a set of related conditions associated with the consumption of mind- and behavior-altering substances that have negative behavioral and health outcomes. Social attitudes and political and legal responses to the consumption of alcohol and illicit drugs make substance abuse one of the most complex public health issues. In addition to the considerable health implications, substance abuse has been a flash-point in the criminal justice system and a major focal point in discussions about social values: people argue over whether substance abuse is a disease with genetic and biological foundations or a matter of personal choice.

Advances in research have led to the development of evidence-based strategies to effectively address substance abuse. Improvements in brain-imaging technologies and the development of medications that assist in treatment have gradually shifted the research community’s perspective on substance abuse. There is now a deeper understanding of substance abuse as a disorder that develops in adolescence and, for some individuals, will develop into a chronic illness that will require lifelong monitoring and care.

Improved evaluation of community-level prevention has enhanced researchers’ understanding of environmental and social factors that contribute to the initiation and abuse of alcohol and illicit drugs, leading to a more sophisticated understanding of how to implement evidence-based strategies in specific social and cultural settings.

A stronger emphasis on evaluation has expanded evidence-based practices for drug and alcohol treatment. Improvements have focused on the development of better clinical interventions through research and increasing the skills and qualifications of treatment providers.

- Healthy People 2020 (www.healthypeople.gov)

Age-Adjusted Cirrhosis/Liver Disease Deaths

Between 2011 and 2013, there was an annual average age-adjusted cirrhosis/liver disease mortality rate of 11.8 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Worse than the statewide rate.
- Worse than the national rate.
- Fails to satisfy the Healthy People 2020 target (8.2 or lower).
- Much higher in Jackson County.

- 2013 PRC National Health Survey, Professional Research Consultants, Inc.
- Asked of all respondents.
- Binge drinkers are defined as men having 5+ alcoholic drinks on any one occasion or women consuming 4+ drinks on any one occasion in the past 30 days.

Excessive Drinking

A total of 13.7% of area adults are excessive drinkers (heavy and/or binge drinkers).

- More favorable than the national proportion.
- Comparable proportions by county.
- Satisfies the Healthy People 2020 target (25.4% or lower).
Excessive Drinkers
Healthy People 2020 Target = 25.4% or Lower

Sources:
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 164]

Notes:
- Asked of all respondents.
- Excessive drinking reflects the number of persons aged 18 years and over who drank more than two drinks per day on average (for men) or more than one drink per day on average (for women) OR who drank 5 or more drinks during a single occasion (for men) or 4 or more drinks during a single occasion (for women) during the past 30 days.
- Excessive drinking is more prevalent among men, adults under 65, and upper-income residents.
Drinking & Driving

Less than one percent of Columbus Regional Hospital Service Area adults (0.8%) acknowledges having driven a vehicle in the past month after they had perhaps too much to drink.

- Below the national findings.
- Most favorable in Jennings County (0.0%).
- TREND: The drinking and driving prevalence has not changed significantly since 1996.

### Have Driven in the Past Month After Perhaps Having Too Much to Drink

<table>

**Notes:**
- As a self-reported measure – and because this indicator reflects potentially illegal behavior – it is reasonable to expect that it might be underreported, and that the actual incidence of drinking and driving in the community is likely higher.

### Age-Adjusted Drug-Induced Deaths

Between 2011 and 2013, there was an annual average age-adjusted drug-induced mortality rate of 15.7 deaths per 100,000 population in the Columbus Regional Hospital Service Area.

- Better than the statewide rate.
- Worse than the national rate.
- Fails to satisfy the Healthy People 2020 target (11.3 or lower).
- Unfavorably high in Jennings County.
Drug-Induced Deaths: Age-Adjusted Mortality
(2011-2013 Annual Average Deaths per 100,000 Population)
Healthy People 2020 Target = 11.3 or Lower

TREND: Although decreasing in recent years, the mortality rate has overall trended upward in the past decade.

Sources:
- CDC WONDER Online Query System. Centers for Disease Control and Prevention, Epidemiology Program Office, Division of Public Health Surveillance and Informatics. Data extracted June 2015.
- Deaths are coded using the Tenth Revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).
- Rates are per 100,000 population, age-adjusted to the 2000 US Standard Population.

Notes:

Notes: Asked of all respondents.

Barriers to Treatment
Among those rating this issue as a “major problem,” the greatest barriers to accessing substance abuse treatment are viewed as:

Access & Lack of Resources
Proximity of treatment centers. – Other Health
The need for treatment far exceeds the facilities available and people’s use of personal agency is clouded by the substance abuse. – Community/Business Leaders
Lack of a local facility. Lack of beds available regionally. – Social Services
Expense, minimal providers. – Community/Business Leaders
Lack of affordable treatment and a local mental health facility which needs an external audit to help it understand its shortcomings. – Community/Business Leaders
Insurance and accepting facilities. – Public Health
Lack of treatment options, lack of knowledge about availability of programs. – Public Health
Limited options for people who are uninsured or underinsured. No residential programs. – Other Health
Where to go, who to see. People don’t acknowledge they have a problem. How to get away from the substance abuse way of life. – Public Health
Most programs are outpatient and are cost prohibitive. – Physicians
Hard to know if and what services, hard to find affordable services. Hard to assist patients to motivate for activation and to reduce harm. – Physicians
Availability and affordability. – Community/Business Leaders
Disconnect between the inpatient treatment and outpatient treatment. Client commitment to change, recovery. Limited resources and connect with the current available resources. – Other Health

Motivation to Seek Treatment
This has been an issue for the ages and continues to be even as the drugs of choice change due to the availability and economic environment of the time. Denial by the user and enabling by close associates are the biggest barriers in my opinion. – Community/Business Leaders
Lack of desire to be treated: cost of treatment. – Other Health
I feel that people develop physical dependence and mental and physical habits that prevent them from seeking help to stop addiction. – Public Health
Often it is a form of self-medication, so there is reluctance to seek treatment. Lack of resources, no insurance or inadequate insurance, social stigma. – Physicians

Hopelessness, using and selling to maintain some cash flow for necessities. – Other Health

Desire for self-indulgence. People don’t want treatment and won’t get it unless and until they have to. – Public Health

Meth is escalating in our community. Lack of motivation to control personal substance abuse is key. Users rarely seek help without outside pressures forcing the issue. – Community/Business Leaders

Stigma

Our communality still prefers not to acknowledge that we have issues in this area and we do not have enough specialized facilities to treatment individuals. – Other Health

Pride, money, and the fear of getting into legal trouble. – Public Health

High Prevalence

Big drug problem, meth, in our area. – Other Health

Most Problematic Substances

Key informants (who rated this as a “major problem”) most often identified alcohol, methamphetamines, and heroin as the most problematic substances abused in the community.

Tobacco Use

About Tobacco Use

Tobacco use is the single most preventable cause of death and disease in the United States. Scientific knowledge about the health effects of tobacco use has increased greatly since the first Surgeon General’s report on tobacco was released in 1964.

Tobacco use causes:

- Cancer
- Heart disease
- Lung diseases (including emphysema, bronchitis, and chronic airway obstruction)
- Premature birth, low birth weight, stillbirth, and infant death

There is no risk-free level of exposure to secondhand smoke. Secondhand smoke causes heart disease and lung cancer in adults and a number of health problems in infants and children, including: severe asthma attacks; respiratory infections; ear infections; and sudden infant death syndrome (SIDS).

Smokeless tobacco causes a number of serious oral health problems, including cancer of the mouth and gums, periodontitis, and tooth loss. Cigar use causes cancer of the larynx, mouth, esophagus, and lung.

Cigarette Smoking

Cigarette Smoking Prevalence

A total of 18.6% of Columbus Regional Hospital Service Area adults currently smoke cigarettes, either regularly (13.5% every day) or occasionally (5.1% on some days).

### Cigarette Smoking Prevalence

(Columbus Regional Hospital Service Area, 2015)

- Regular Smoker 13.5%
- Occasional Smoker 5.1%
- Former Smoker 25.2%
- Never Smoked 56.1%

Sources:
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 156]

Notes:
- Asked of all respondents.

- Similar to statewide findings.
- Less favorable than national findings.
- Fails to satisfy the Healthy People 2020 target (12% or lower).
- Least favorable in Jennings County.
TREND: The current smoking percentage marks a statistically significant decrease since 1996.

Current Smokers
**Healthy People 2020 Target = 12.0% or Lower**

Bartholomew County

Current Smokers
(Columbus Regional Hospital Service Area, 2015)
**Healthy People 2020 Target = 12.0% or Lower**

Cigarette smoking is more prevalent among:

- Adults under 65.
- Lower-income residents.

**Current Smokers**

Sources:
- PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 156]
- 2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes:
- Asked of all respondents.
- Includes regular and occasional smokers (those who smoke cigarettes everyday or on some days).
- Hispanic can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondents household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
- Includes regular and occasional smokers (everyday and some days).
Among current smokers, the vast majority (95.6%) smokes less than one pack per day.

- **TREND:** The median number of daily cigarettes smoked among current CRH Service Area smokers is 10 (the 2012 median was 12 cigarettes).

### Average Number of Cigarettes Smoked per Day
(CRH Service Area Former Smokers, 2015)

- **1 Pack/Day or Less:** 95.6%
- **>1 to 2 Packs/Day:** 4.4%

Median Response = 10 Cigarettes per Day (2012 = 12)

**Sources:** 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 312]

**Notes:**
- Asked of all current smokers.
- One pack = 20 cigarettes.

### Environmental Tobacco Smoke

A total of 13.2% of Columbus Regional Hospital Service Area adults (including smokers and non-smokers) report that a member of their household has smoked cigarettes in the home an average of 4+ times per week over the past month.

- Comparable to national findings.
- Comparable findings by county.
- **TREND:** Marks a statistically significant decrease over time.
- Note that 8.4% of Columbus Regional Hospital Service Area non-smokers are exposed to cigarette smoke at home, similar to what is found nationally.
**Member of Household Smokes at Home**

- Notably higher among residents age 40 to 64 and those with lower incomes.

**Member of Household Smokes At Home**
(Columbus Regional Hospital Service Area, 2015)

Among households with children, 10.3% have someone who smokes cigarettes in the home.

- Similar to national findings.
- The Bartholomew County prevalence is 10.7%.
- TREND: Marks a statistically significant decrease over time.

**Notes:**
- Reflects respondents with children 0 to 17 in the household.
- "Smokes at home" refers to someone smoking cigarettes, cigars, or a pipe in the home an average of four or more times per week in the past month.

### Smoking Cessation

#### About Reducing Tobacco Use

Preventing tobacco use and helping tobacco users quit can improve the health and quality of life for Americans of all ages. People who stop smoking greatly reduce their risk of disease and premature death. Benefits are greater for people who stop at earlier ages, but quitting tobacco use is beneficial at any age.

Many factors influence tobacco use, disease, and mortality. Risk factors include race/ethnicity, age, education, and socioeconomic status. Significant disparities in tobacco use exist geographically; such disparities typically result from differences among states in smoke-free protections, tobacco prices, and program funding for tobacco prevention.

- Healthy People 2020 (www.healthypeople.gov)

#### Former Smokers

Former smokers in the service area were asked to report on the factors which prompted them to quit smoking altogether.

The largest share of former smokers (40.1%) cited health concerns as their impetus for smoking cessation, followed by references to being “ready to quit” (24.0%) and pressure from loved ones (13.9%).

- Other factors mentioned with less frequency included the cost/price increase of cigarettes, social pressure, and a physician’s recommendation.
Factors Prompting Smoking Cessation
(CRH Service Area Former Smokers, 2015)

- Health Concerns: 40.1%
- Ready to Quit: 24.0%
- Other: 4.3%
- Dr’s Recommendation: 4.9%
- Social Pressure: 6.2%
- Cost/Price Increase: 6.6%
- Pressure from Loved One: 13.9%

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 311]
Notes: Asked of those respondents who were previous smokers.

Awareness of the Indiana Tobacco Quit Line

More than one-half of CRH Service Area adults (55.0%) are aware of the Indiana Tobacco Quit Line (1-800-QUIT-NOW).

- Awareness is reported among 86.3% of current smokers and 91.8% of smokeless tobacco users (this sample size is quite small).
- TREND: In Bartholomew County, awareness has decreased significantly over time.

Aware of the Indiana Tobacco Quit Line: 1-800-QUIT-NOW
(Columbus Regional Hospital Service Area, 2015)

- Among Current Smokers: Yes 86.3%, No 13.7%
- Among Smokeless Tobacco Users: Yes 91.8%, No 8.2%
- Among All Adults (Tobacco Users & Non-Users): Yes 55.0%, No 45.0%

Sources: 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 313]
Notes: Asked of all respondents.
• Note the negative correlation between quit-line awareness and age in the service area.

</tbody>
</table>

**Top Concerns**

Among those rating this issue as a “major problem,” reasons frequently related to the following:
Prevalence of Tobacco Use

- **Public Health**: We still have high rates of tobacco use.
- **Public Health**: In my scope of practice, many of the adults that I interact with use tobacco.
- **Other Health**: High percentage of smokers.
- **Other Health**: A high percentage of the patients who use volunteers in Medicine Clinic are smokers.
- **Physicians**: Rates of tobacco use in Indiana, especially in southern IN, are still above the national average. Many parents smoke and therefore teens have access to tobacco.
- **Physicians**: Indiana has a very high rate of tobacco use.
- **Other Health**: State statistics, cancer incidence rates, lung cancer mortality and morbidity.
- **Other Health**: High smoking rates, high rate of cultural acceptance of tobacco use.
- **Physicians**: Major in the low income population.
- **Public Health**: There are ongoing programs in our community to battle the high level of tobacco use. However, we still continue to have high smoking rates among low-income, low education. We need affordable tobacco cessation clinics in all the large industries. Additionally, we need accountability on the smoker’s if they expect to receive health insurance from their employers. The issue has to stay on our radar screen before we will see a decline.

Teen Smokers

- **Other Health**: Although the rate of smoking has decreased significantly, still an issue with the adolescent population.
- **Public Health**: The amount of students I see smoking and their parents leads me to believe that there is still an issue with smoking. It is not just children of smokers that are smoking either.
- **Public Health**: It is getting slightly better, but there are a number of smokers congregating outside businesses and restaurants. Also, a number of students can be seen just off high school grounds smoking and vaping.
- **Physicians**: High school students seem to think vaping is not a problem.

Comorbidities

- **Other Health**: Smoking has a major impact on overall health and affects other factors for many. The cost alone is an issue as well as the cost of treating the conditions as a result of smoking. The treatment for these conditions is costly and chronic. Second hand smoke in homes is also a concern. Often financial resources go to this when they could be diverted to other costs.
- **Other Health**: High number of clients we see with smoking related COPD. Students seen to be smoking just off the high school campuses.
Health Insurance Coverage

Type of Healthcare Coverage
A total of 71.7% of Columbus Regional Hospital Service Area adults age 18 to 64 report having healthcare coverage through private insurance. Another 21.6% report coverage through a government-sponsored program (e.g., Medicaid, Medicare, military benefits).

Prescription Drug Coverage
Among insured adults, 93.9% report having prescription coverage as part of their insurance plan.

- Almost identical to the national prevalence.
- Statistically comparable findings by county.
- TREND: Statistically unchanged over time.
Health Insurance Covers Prescriptions at Least in Part
(Among Insured Respondents)

Supplemental Coverage
Among Medicare recipients, the majority (73.9%) has additional, supplemental healthcare coverage.

- Comparable to that reported among Medicare recipients nationwide.
- The Bartholomew County prevalence is 81.0%.
- TREND: Statistically similar to the proportion reported in 2006.

Have Supplemental Coverage in Addition to Medicare
(Among Adults Age 65+)

Sources: PRC Community Health Surveys, Professional Research Consultants, Inc. [Item 322]
2013 PRC National Health Survey, Professional Research Consultants, Inc.

Notes: Asked of respondents age 65+. 
Lack of Health Insurance Coverage

Among adults age 18 to 64, 6.8% report having no insurance coverage for healthcare expenses.

- Well below the state finding.
- Well below the national finding.
- The Healthy People 2020 target is universal coverage (0% uninsured).
- Favorably low in Jennings County.
- TREND: Marks a statistically significant decrease over time.

Lack of Healthcare Insurance Coverage
(Among Adults Age 18-64)
Healthy People 2020 Target = 0.0% (Universal Coverage)

The following population segments (age 18-64) are more likely to be without healthcare insurance coverage:

- Men.
- Residents living at lower incomes.
Lack of Healthcare Insurance Coverage
(Among Adults Age 18-64; Columbus Regional Hospital Service Area, 2015)
Healthy People 2020 Target = 0.0% (Universal Coverage)

Recent Lack of Coverage
Among currently insured adults in the Columbus Regional Hospital Service Area, 7.2% report that they were without healthcare coverage at some point in the past year.

- Similar to US findings.
- Unfavorably high in Jennings County.
- TREND: Statistically unchanged over time.

Went Without Healthcare Insurance Coverage At Some Point in the Past Year
(Among Insured Adults)

Sources:
- 2015 PRC Community Health Survey, Professional Research Consultants, Inc. [Item 165]

Notes:
- Asked of all respondents under the age of 65.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.

Went Without Healthcare Insurance Coverage At Some Point in the Past Year
(Among Insured Adults)
Among insured adults, the following segments are more likely to have gone without healthcare insurance coverage at some point in the past year:

- Men.
- Adults under age 65 (negative correlation with age).
- Lower-income residents.

- Asked of all insured respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent’s household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Difficulties Accessing Healthcare

About Access to Healthcare

Access to comprehensive, quality health care services is important for the achievement of health equity and for increasing the quality of a healthy life for everyone. It impacts: overall physical, social, and mental health status; prevention of disease and disability; detection and treatment of health conditions; quality of life; preventable death; and life expectancy.

Access to health services means the timely use of personal health services to achieve the best health outcomes. It requires three distinct steps: 1) Gaining entry into the health care system; 2) Accessing a health care location where needed services are provided; and 3) Finding a health care provider with whom the patient can communicate and trust.

- Healthy People 2020 (www.healthypeople.gov)

Barriers to Healthcare Access

Of the tested barriers, obtaining a medical appointment impacted the greatest share of Columbus Regional Hospital Service Area adults.

- The proportion of Columbus Regional Hospital Service Area adults impacted was statistically better than that found nationwide for each of the tested barriers.

Accessing Healthcare for Children

A total of 1.3% of parents say there was a time in the past year when they needed medical care for their child, but were unable to get it.

- Well below the proportion reported nationwide.
- The Bartholomew County prevalence is 1.4%.
- TREND: Denotes a statistically significant decrease since 2003.

Had Trouble Obtaining Medical Care for Child in the Past Year
(Among Parents of Children 0-17)

Among the parents experiencing difficulties, the majority cited insurance issues as the primary reason; others cited poor quality care and long waits for appointments.

Prescriptions

Among all Columbus Regional Hospital Service Area adults, 81.8% report that they would be able to describe the dosage and directions for any prescriptions they might have if asked by a medical physician.

A much lower percentage of CRH Service Area residents (14.6%) report that they have stopped taking a prescription medication in the past 3 years without a doctor’s order.
Prescription Medication Use
(Columbus Regional Hospital Service Area, 2015)

- With regard to respondents’ knowledge of medication dosage and directions, no statistically significant differences in findings when viewed by demographics or county of residence.

**Notes:**
- Asked of all respondents.
- Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).
- Income categories reflect respondent's household income as a ratio to the federal poverty level (FPL) for their household size. "Low Income" includes households with incomes up to 200% of the federal poverty level; "Mid/High Income" includes households with incomes at 200% or more of the federal poverty level.

**Top Concerns**

Among those rating this issue as a “major problem,” reasons frequently related to the following:
Access to Care

Having access to primary and specialty medical care within 48 hours of seeking an appointment.
Appointment times that vary according to schedules needed by people who work traditional hours. – Community/Business Leaders

New HIP people, growing Medicare demographic, increased needs and demands to deliver what is now considered quality care to all people. – Physicians

Undocumented immigrants and those who fall in the Medicaid Expansion gap and cannot afford the premiums. – Social Services

Students and their families don’t know where to get health care services, don’t have the funds for health care or are afraid they will be deported if they do go get help. – Public Health

Primary care access is an issue in this community. Many are seeking alternatives such as Employer Clinics, Minute Clinics. That is a very uncoordinated way to deliver healthcare. Access needs to be addressed. – Other Health

Lack of Providers

Not enough providers who accept government assisted health plans. People who do not understand the requirements of their particular insurance plan such as premium, deductible, co-pay. Participants who do not keep their information current with DFR and lose their coverage for several months. The high cost of in demand medications such as insulin, mental health medicines and respiratory medicine. – Other Health

Not enough primary care providers for persons eligible for Medicaid and the Indiana plan. No insurance for undocumented residents. – Physicians

We are short family practice physicians and our practices are full. – Other Health

Type of Care Most Difficult to Access

Key informants (who rated this as a “major problem”) most often identified primary care, mental health care, substance abuse treatment and chronic disease care as the most difficult to access in the community.

Primary Care Services

About Primary Care

Improving health care services depends in part on ensuring that people have a usual and ongoing source of care. People with a usual source of care have better health outcomes and fewer disparities and costs. Having a primary care provider (PCP) as the usual source of care is especially important. PCPs can develop meaningful and sustained relationships with patients and provide integrated services while practicing in the context of family and community. Having a usual PCP is associated with:

- Greater patient trust in the provider
- Good patient-provider communication
- Increased likelihood that patients will receive appropriate care

Improving health care services includes increasing access to and use of evidence-based preventive services. Clinical preventive services are services that: prevent illness by detecting early warning signs or symptoms before they develop into a disease (primary prevention); or detect a disease at an earlier, and often more treatable, stage (secondary prevention).

- Healthy People 2020 (www.healthypeople.gov)

Access to Primary Care

In the Columbus Regional Hospital Service Area in 2012, there were 101 primary care physicians, translating to a rate of 67.2 primary care physicians per 100,000 population.

- Similar to the primary care physician-to-population ratio found statewide.
- Lower than the ratio found nationally.
- Much higher in Bartholomew County than in Jennings and Jackson counties.

Sources:

Notes:
- This indicator is relevant because a shortage of health professionals contributes to access and health status issues.

- TREND: Access to primary care (in terms of the ratio of primary care physicians to population) has ranged from 61.1 to 71.8 over the past decade in the service area.
Trends in Access to Primary Care
(Number of Primary Care Physicians per 100,000 Population)

Sources:

Notes:
- This indicator is relevant because unemployment creates financial instability and barriers to access including insurance coverage, health services, healthy food, and other necessities that contribute to poor health status.
- These figures represent all primary care physicians practicing patient care, including hospital residents. In counties with teaching hospitals, this figure may differ from the rate reported in the previous chart.

Regular Site for Medical Care
A total of 88.0% of Columbus Regional Hospital Service Area adults have a regular physician or clinic where they go for their medical care.

- Higher than the state proportion.
- Higher than the US proportion.
- Statistically comparable by county.
- TREND: Statistically unchanged from baseline 1996 data.

### Type of Place Preferred for Medical Care

When asked whether they prefer to see their usual physician who knows their medical history or to utilize a walk-in or urgent-care clinic for their medical care, most CRH Service Area adults (80.3%) would prefer their usual physician.
The preference for physicians or clinics does not vary significantly by county in the CRH Service Area.

When viewed by demographic characteristics, the following population segments are more likely to prefer their usual physician for their medical care:

- Adults age 40 and older (positive correlation with age).
- Upper-income residents.
In contrast, these adults are more likely to prefer an urgent-care or walk-in clinic for their medical care:

- Young adults.
- Lower-income adults.
Utilization of Primary Care Services

**Adults**

Nearly 3 in 4 adults (73.8%) visited a physician for a routine checkup in the past year.

- Higher than state findings.
- Higher than national findings.
- Comparable by county.
- TRENDS: Statistically similar to 1996 findings.

Hispanics can be of any race. Other race categories are non-Hispanic categorizations (e.g., “White” reflects non-Hispanic White respondents).

Income categories reflect respondent's household income as a ratio to the federal poverty level (FPL) for their household size. “Low Income” includes households with incomes up to 200% of the federal poverty level; “Mid/High Income” includes households with incomes at 200% or more of the federal poverty level.
Oral Health

About Oral Health

Oral health is essential to overall health. Good oral health improves a person’s ability to speak, smile, smell, taste, touch, chew, swallow, and make facial expressions to show feelings and emotions. However, oral diseases, from cavities to oral cancer, cause pain and disability for many Americans. Good self-care, such as brushing with fluoride toothpaste, daily flossing, and professional treatment, is key to good oral health. Health behaviors that can lead to poor oral health include: **tobacco use; excessive alcohol use; and poor dietary choices.**

The significant improvement in the oral health of Americans over the past 50 years is a public health success story. Most of the gains are a result of effective prevention and treatment efforts. One major success is community water fluoridation, which now benefits about 7 out of 10 Americans who get water through public water systems. However, some Americans do not have access to preventive programs. People who have the least access to preventive services and dental treatment have greater rates of oral diseases. A person’s ability to access oral healthcare is associated with factors such as education level, income, race, and ethnicity.

Barriers that can limit a person’s use of preventive interventions and treatments include: limited access to and availability of dental services; lack of awareness of the need for care; cost; and fear of dental procedures.

There are also social determinants that affect oral health. In general, people with lower levels of education and income, and people from specific racial/ethnic groups, have higher rates of disease. People with disabilities and other health conditions, like diabetes, are more likely to have poor oral health.

Potential strategies to address these issues include:

- Implementing and evaluating activities that have an impact on health behavior.
- Promoting interventions to reduce tooth decay, such as dental sealants and fluoride use.
- Evaluating and improving methods of monitoring oral diseases and conditions.
- Increasing the capacity of State dental health programs to provide preventive oral health services.
- Increasing the number of community health centers with an oral health component.

**Healthy People 2020** ([www.healthypeople.gov](http://www.healthypeople.gov))

Dental Care

Adults

A total of 67.5% of Columbus Regional Hospital Service Area adults have visited a dentist or dental clinic (for any reason) in the past year.

- Higher than statewide findings.
- Comparable to national findings.
- Satisfies the Healthy People 2020 target (49% or higher).
- Lower in Jennings County.
- TRENDS: Statistically unchanged from the 1996 percentage.
Have Visited a Dentist or Dental Clinic Within the Past Year
Healthy People 2020 Target = 49.0% or Higher

These adults are less likely to have received dental care in the past year:

- Men.
- Persons living in the lower income category (low-income adults fail to satisfy the Healthy People 2020 target).
Children

A total of 88.7% of parents report that their child (age 2 to 17) has been to a dentist or dental clinic within the past year.

- More favorable than national findings.
- Satisfies the Healthy People 2020 target (49% or higher).
- In Bartholomew County, the prevalence is 90.0%.
- TREND: Marks a statistically significant increase in children's dental care since 1996.

Key Informant Input: Oral Health

Key informants taking part in an online survey most often characterized Oral Health as a “moderate problem” in the community.
Top Concerns

Among those rating this issue as a “major problem,” reasons frequently related to the following:

Insurance Coverage & Access to Care

Many do not have insurance, and even with insurance sometimes co-pays seem too much for people to take on. Also, there is a lot of fear that keeps parents from seeking care for their children. – Physicians

Dental care has improved greatly over the last decade, however insurances doesn’t typically keep up with adequate coverage to meet the rising costs. I am concerned that parents and adults do not keep up with dental care and may increase the need for extensive care. – Community/Business Leaders

Major problem to our low-income population. Many children with dental cavities and broken teeth in elementary. Many children have never seen the dentist. Many tooth aches in this population. Parents of these children have poor dental health as well. – Public Health

Few people have dental insurance, so many do not receive regular preventative care. Poor diet and oral hygiene compound the problem. – Physicians

This may well be addressed to some degree with the institution of the new HIP 2.0. Access to services has been an issue and cost for those with limited resources. Poor diet and health habits are also contributing factors so this could be address with the nutrition issues. Drug abuse also is a factor for this area. Many are going to the dentist less, like seeing their primary care provider with the reduction of coverage, increase in deductibles and copays. I think we are just beginning to see the impact of changes in health coverage for middle class in all areas. – Other Health

Lack of Preventive Care

Lack of preventive dental care. – Social Services
Healthcare Resources
Resources Available to Address the Significant Health Needs

The following represent potential measures and resources (such as programs, organizations, and facilities in the community) available to address the significant health needs identified in this report. This list is not exhaustive, but rather outlines those resources identified in the course of conducting this Community Health Needs Assessment.
